

Support student learning wherever and whenever students may need it with
Dynamic study modules

Dynamic study modules or dsms are an
Adaptive practice environment that helps
students increase their confidence and
deepen their understanding of course
material so that they are better
prepared to succeed in their course
Dynamic study modules use a combination
of 23 cognitive triggers including
confidence and delayed corrective
feedback that are proven to help
students succeed

Dynamic study modules can be assigned
from the mylab assignment manager
accessed independently
the dynamic study modules are organized
by module

and pose a series of questions about a
topic asking students to express
confidence

along with their answers

these Dynamic study modules can be
accessed in browser or on mobile
after answering a selection of questions
students must then review course content
related to questions that have been
answered incorrectly unsure or correctly
but unsure the module completes once the
student has answered all questions with
confidence typically within 30 minutes
these scores feed a robust reporting
dashboard and completion flows to the
mylab statistics gradebook
