ABOUT THIS BOOK

The following three themes have been fully integrated throughout the Pearson Edexcel International Advanced Level in Mathematics series, so they can be applied alongside your learning.

1. Mathematical argument, language and proof
   • Rigorous and consistent approach throughout
   • Notation boxes explain key mathematical language and symbols

2. Mathematical problem-solving
   • Hundreds of problem-solving questions, fully integrated into the main exercises
   • Problem-solving boxes provide tips and strategies
   • Challenge questions provide extra stretch

3. Transferable skills
   • Transferable skills are embedded throughout this book, in the exercises and in some examples
   • These skills are signposted to show students which skills they are using and developing

Finding your way around the book

Glossary terms will be identified by bold blue text on their first appearance.

Each chapter starts with a list of Learning objectives

The Prior knowledge check helps make sure you are ready to start the chapter

The real world applications of the maths you are about to learn are highlighted at the start of the chapter.

Each chapter is mapped to the specification content for easy reference
About This Book

Exercise questions are carefully graded so they increase in difficulty and gradually bring you up to exam standard.

Problem-solving boxes provide hints, tips and strategies, and Watch out boxes highlight areas where students often lose marks in their exams.

Each section begins with explanation and key learning points

Step-by-step worked examples focus on the key types of questions you’ll need to tackle

Transferable skills are signposted where they naturally occur in the exercises and examples

Exercises are packed with exam-style questions to ensure you are ready for the exams

Exam-style questions are flagged with Problem-solving questions are flagged with

Each chapter ends with a Chapter review and a Summary of key points

After every few chapters, a Review exercise helps you consolidate your learning with lots of exam-style questions.

Exam Practice

Mathematics International Advanced Subsidiary/Advanced Level Statistics 1

Time: 1 hour 30 minutes

You must have Mathematical Formulae and Statistical Tables. Calculator Answer All questions.

Problem-solving boxes

A full practice paper at the back of the book helps you prepare for the real thing.
QUALIFICATION AND ASSESSMENT OVERVIEW

Qualification and content overview
Statistics 1 (S1) is an optional unit in the following qualifications:
International Advanced Subsidiary in Mathematics
International Advanced Subsidiary in Further Mathematics
International Advanced Level in Mathematics
International Advanced Level in Further Mathematics

Assessment overview
The following table gives an overview of the assessment for this unit.
We recommend that you study this information closely to help ensure that you are fully prepared for this course and know exactly what to expect in the assessment.

<table>
<thead>
<tr>

Calculators

Students may use a calculator in assessments for these qualifications. Centres are responsible for making sure that calculators used by their students meet the requirements given in the table below.

Students are expected to have available a calculator with at least the following keys: +, -, x, -, ÷, \(\pi\), \(x^2\), \(\sqrt{x}\), \(\frac{1}{x}\), \(x^n\), ln \(x\), e \(x\), sx, cos, and tangent and their inverses in degrees and decimals of a degree, and in radians; memory.

Prohibitions

Calculators with any of the following facilities are prohibited in all examinations:

• databanks
• retrieval of text or formulae
• built-in symbolic algebra manipulations
• symbolic differentiation and/or integration
• language translators
• communication with other machines or the internet
**Extra online content**

Whenever you see an *Online* box, it means that there is extra online content available to support you.

**SolutionBank**

SolutionBank provides worked solutions for questions in the book. Download the solutions as a PDF or quickly find the solution you need online.

**Use of technology**

Explore topics in more detail, visualise problems and consolidate your understanding. Use pre-made GeoGebra activities or Casio resources for a graphic calculator.

**GeoGebra**

GeoGebra-powered interactives

Interact with the mathematics you are learning using GeoGebra’s easy-to-use tools

**CASIO**

Graphic calculator interactives

Explore the mathematics you are learning and gain confidence in using a graphic calculator

**Calculator tutorials**

Our helpful video tutorials will guide you through how to use your calculator in the exams. They cover both Casio’s scientific and colour graphic calculators.

**Online**

Work out each coefficient quickly using the \( nC_r \) and power functions on your calculator.

Step-by-step guide with audio instructions on exactly which buttons to press and what should appear on your calculator's screen
Imagine that a scientist discovers that the number of leopards in Sri Lanka changes from year to year, and she wants to investigate these changes. Instead of tracking every leopard, she can create a mathematical model. By using a mathematical model, the investigation becomes more manageable, less time-consuming and cheaper. It also enables the scientist to make predictions.

After completing this chapter you should be able to:

- Understand what mathematical modelling is → page 2
- Design a simple mathematical model → pages 3–4

Prior knowledge check

1. Write down the definition for qualitative and quantitative data. ← International GCSE Mathematics
2. List three areas outside of mathematics where statistics can be used. ← International GCSE Mathematics
1.1 Mathematical models

A **mathematical model** is a simplification of a real-world situation. It can be used to make **predictions** and forecasts about real-world situations. This helps solve and improve the understanding of real-world situations by analysing the results and the **model**.

The model will aim to include all the main features of the real-world situation but, given the difficulties of the real world, the model may have to be based on certain assumptions. As a result, these assumptions will need to be taken into consideration when analysing the results.

There are many advantages of mathematical models, and these include (but are not limited to):

- they are relatively quick and easy to produce
- they are usually a much more cost-effective way of analysing the real-world situation
- they enable predictions to be made
- they help improve the understanding of our world
- they help show how certain changes in **variables** will affect the outcomes
- they help simplify complex situations.

However, mathematical models do have disadvantages, and these include:

- simplification of the real-world situation can cause errors, as the model does not include all aspects of the problem and may have included some assumptions
- the model may work only in certain conditions that are difficult or expensive to fulfil in the real world.

**Example 1**

Give two advantages and disadvantages of using a mathematical model:

<table>
<thead>
<tr>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>They are relatively quick and easy to produce</td>
<td>Simplification of a real-world situation may cause errors as the model is too simplistic</td>
</tr>
<tr>
<td>They help enable predictions to be made</td>
<td>The model may work only in certain conditions</td>
</tr>
</tbody>
</table>
1.2 Designing a model

The process of designing a model generally involves seven stages, outlined below.

Stage 1: The recognition of a real-world problem
Stage 2: A mathematical model is devised
Stage 3: Model used to make predictions about the behaviour of the real-world problem
Stage 4: Experimental data are collected from the real world
Stage 5: Comparisons are made against the devised model
Stage 6: Statistical concepts are used to test how well the model describes the real-world problem
Stage 7: Model is refined

Example 2

A scientist is investigating the population of owls and notices that the population varies year to year. Give a summary of the stages that are needed to create a mathematical model for this population variation.

1. Some assumptions need to be made to ensure the model is manageable. Birth and death rates of owls should be included, but food supply and environment changes should not.
2. Plan a mathematical model which will include diagrams.
3. Use this model to predict the population of the owls over a period of years.
4. Include and collect fresh data that match the conditions of the predicted values. You may also use historical data from the previous years.
5. Analyse the data using techniques you will meet in this course to compare the predicted data with the experimental data.
6. Use statistical tests that will provide an objective means of deciding if the differences between the model’s predictions and experimental data are within acceptable limits.

If the predicted values do not match the experimental data closely enough, then the model can be refined. This will involve repeating and refining steps 2–6. This model is then constantly refined making the model more and more accurate.

Exercise 1A

1. Briefly explain the role of statistical tests in the process of mathematical modelling.
2. Describe how to refine the process of designing a mathematical model.
3 It is generally accepted that there are seven stages involved in creating a mathematical model. They are summarised below. Write down the missing stages.

Stage 1: The recognition of a real-world problem
Stage 2: A mathematical model is devised
Stage 3: Model used to make predictions
Stage 4: Experimental data collected
Stage 5: Comparisons are made against the devised model
Stage 6: Statistical concepts are used to test how well the model describes the real-world problem
Stage 7: Model is refined

Chapter review

1 Mathematical models can simplify real-world problems and are a quick way to describe a real-world situation. Give two other reasons why mathematical models are used.

2 Give two advantages and two disadvantages of the use of mathematical models.

3 Explain how mathematical modelling can be used to investigate climate change.

4 A statistician is investigating population growth in Southeast Asia. Give a summary of the stages that are needed to create a mathematical model for this investigation.

Summary of key points

1 A mathematical model is a simplification of a real-world situation.

2 It is generally accepted that there are seven stages involved in creating a mathematical model.
   • Stage 1: The recognition of a real-world problem
   • Stage 2: A mathematical model is devised
   • Stage 3: Model used to make predictions
   • Stage 4: Experimental data collected
   • Stage 5: Comparisons are made against the devised model
   • Stage 6: Statistical concepts are used to test how well the model describes the real-world problem
   • Stage 7: Model is refined

3 There are advantages and disadvantages to mathematical models. Some of these are:

<table>
<thead>
<tr>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>They are relatively quick and easy to produce</td>
<td>Simplification of a real-world situation may cause errors as the model is too simplistic</td>
</tr>
<tr>
<td>They help enable predictions to be made</td>
<td>The model may work only in certain conditions</td>
</tr>
</tbody>
</table>
Learning objectives

After completing this chapter you should be able to:

- Recognise different types of data → pages 6–8
- Calculate measures of central tendency such as the mean, median and mode → pages 9–12
- Calculate measures of location such as percentiles → pages 13–15
- Calculate measures of spread such as range, interquartile range and interpercentile range → pages 16–17
- Calculate variance and standard deviation → pages 18–21
- Understand and use coding → pages 21–25

Prior knowledge check

1. Calculate the mean, mode and median of the following data:
   10, 12, 38, 23, 38, 23, 21, 27, 38
   ← International GCSE Mathematics

2. A train runs for 3 hours at a speed of 65 km per hour, and for the next 2 hours at a speed of 55 km per hour. Find the mean speed of the train for the 5 hour journey.
   ← International GCSE Mathematics

3. Find the mean, median, mode and range of the data shown in this frequency table.

<table>
<thead>
<tr>
<th>Number of peas in a pod</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>4</td>
<td>7</td>
<td>11</td>
<td>18</td>
<td>6</td>
</tr>
</tbody>
</table>

← International GCSE Mathematics

Wildlife biologists use statistics such as mean wingspan and standard deviation to compare populations of endangered birds in different habitats.
2.1 Types of data

In statistics, we collect observations or measurements of some variables. These observations are known as data. Variables associated with non-numerical data are **qualitative variables**, and variables associated with numerical data are **quantitative variables**. The flowchart below shows different types of data in more detail.

**Types of data**

- **Qualitative (Non-numerical data)**
  - Examples include favourite colour or favourite animal

- **Quantitative (Numerical data)**
  - **Discrete data** - Takes specific values in a given range
    - Examples include number of girls in a family or number of bowling pins left standing
  - **Continuous data** - Takes any value in a given range
    - Examples include a person’s weight or the distance between two points

**Example 1**

State whether each of the following variables is continuous or discrete.

- **a** Sprint times for a 100 m race
- **b** Length
- **c** Number of 10 cent coins in a bag
- **d** Number of boys in a family

- **a** Sprint times are continuous
- **b** Length is continuous
- **c** Number of 10 cent coins is discrete
- **d** Number of boys in a family is discrete

**Hint**

- A variable that can take only specific values in a given range is a **discrete variable**.
- A variable that can take any value in a given range is a **continuous variable**.

**Time can take any value, as determined by the accuracy of the measuring device. For example: 9 seconds, 9.1 seconds, 9.08 seconds, 9.076 seconds, etc.**

**You can’t have 5.62 coins.**

**You can’t have 2.45 boys in a family.**
Large amounts of discrete data can be written as a frequency table or as grouped data. For example, the table below shows the number of students with a specific shoe size.

<table>
<thead>
<tr>
<th>Shoe size ($x$)</th>
<th>Number of students, $f$</th>
</tr>
</thead>
<tbody>
<tr>
<td>39</td>
<td>3</td>
</tr>
<tr>
<td>40</td>
<td>17</td>
</tr>
<tr>
<td>41</td>
<td>29</td>
</tr>
<tr>
<td>42</td>
<td>34</td>
</tr>
<tr>
<td>43</td>
<td>12</td>
</tr>
</tbody>
</table>

The number of anything is called its frequency, where $f$ stands for frequency.

A frequency table is a quick way of writing a long list of numbers. For instance, this table tells us that 3 students have a shoe size of 39, and 17 students have a shoe size of 40, etc.

Data can also be presented as a grouped frequency table. The specific data values are not included in the table, instead they are grouped. You will need to know:

- the groups are commonly known as classes
- how to find the class boundaries
- how to find the midpoint of a class
- how to find the class width.

**Example 2**  
**SKILLS**  
**INTERPRETATION**

The time, $x$ seconds, taken by a random sample of females to run 400 m is measured and is shown in two different tables.

a. Write down the class boundaries for the first row of each table.

b. Find the midpoint and class width for the first row for each table.

<table>
<thead>
<tr>
<th>Table 1</th>
<th>Table 2</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Time to run 400 m (s)</strong></td>
<td><strong>Number of females $f$</strong></td>
</tr>
<tr>
<td>55–65</td>
<td>2</td>
</tr>
<tr>
<td>65–70</td>
<td>25</td>
</tr>
<tr>
<td>70–75</td>
<td>30</td>
</tr>
<tr>
<td>75–90</td>
<td>13</td>
</tr>
</tbody>
</table>

It may seem that the classes overlap. However, this is not the case, as 55–65 is the shorthand form of writing $55 < x < 65$.

**a** The class boundaries for Table 1 are 55 s, 65 s as the data has no gaps and therefore the class boundaries are the numbers of the class. The class boundaries for Table 2 are 54.5 s, 65.5 s because the data has gaps.

**b** The midpoint for Table 1 is $\frac{1}{2}(55 + 65) = 60$

The midpoint for Table 2 is $\frac{1}{2}(54.5 + 65.5) = 60$

The class width for Table 1 is 65 – 55 = 10

The class width for Table 2 is 65.5 – 54.5 = 11
1 State whether each of the following variables is qualitative or quantitative:
   a The height of a building
   b The colour of a jumper
   c Time spent waiting in a queue
   d Shoe size
   e Names of students in a school

2 State which of the following statements are true:
   a The weight of apples is discrete data.
   b The number of apples on the trees in an orchard is discrete data.
   c The amount of time it takes a train to make a journey is continuous data.
   d Simhal collected data on car colours by standing at the end of her road and writing down
      the car colours. The data she collected is quantitative.

3 The distribution of the lifetimes of torch batteries are shown in the grouped frequency table below.
   a Write down the class boundaries for the second group.
   b Work out the midpoint of the fifth group.

<table>
<thead>
<tr>
<th>Lifetime (Nearest 0.1 of an hour)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0–5.9</td>
<td>5</td>
</tr>
<tr>
<td>6.0–6.9</td>
<td>8</td>
</tr>
<tr>
<td>7.0–7.9</td>
<td>10</td>
</tr>
<tr>
<td>8.0–8.9</td>
<td>22</td>
</tr>
<tr>
<td>9.0–9.9</td>
<td>10</td>
</tr>
<tr>
<td>10.0–10.9</td>
<td>2</td>
</tr>
</tbody>
</table>

4 The grouped frequency table below shows the distributions of the weights of 16-week-old kittens.
   a Write down the class boundaries for the third group.
   b Work out the midpoint of the second group.

<table>
<thead>
<tr>
<th>Weight (kg)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.2–1.3</td>
<td>8</td>
</tr>
<tr>
<td>1.3–1.4</td>
<td>28</td>
</tr>
<tr>
<td>1.4–1.5</td>
<td>32</td>
</tr>
<tr>
<td>1.5–1.6</td>
<td>22</td>
</tr>
</tbody>
</table>

Hint Sometimes it is not possible or practical to count the number of all the objects in a set, but that number is still discrete. For example, counting the number of apples on all the trees in an orchard or the number of bricks in a multi-storey building might not be possible (or desirable!) but nonetheless these are still discrete numbers.
2.2 Measures of central tendency

A measure of location is a single value which describes a position in a data set. If the single value describes the centre of the data, it is called a measure of central tendency. You should already know how to work out the mean, median and mode of a set of ungrouped data and from ungrouped frequency tables.

- The mode or modal class is the value or class that occurs most often.
- The median is the middle value when the data values are put in order.
- The mean can be calculated using the formula \( \bar{x} = \frac{\sum x}{n} \)

Combining means

If set \( A \), of size \( n_1 \), has mean \( \bar{x}_1 \) and set \( B \), of size \( n_2 \), has a mean \( \bar{x}_2 \), then the mean of the combined set of \( A \) and \( B \) is:

\[
\bar{x} = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}
\]

Example

The mean of a sample of 25 observations is 6.4. The mean of a second sample of 30 observations is 7.2. Calculate the mean of all 55 observations.

For the first set of observations:

\[
\bar{x} = \frac{\sum x}{n}, \text{ so } 6.4 = \frac{\sum x}{25}
\]

\[
\sum x = 6.4 \times 25 = 160
\]

For the second set of observations:

\[
\bar{y} = \frac{\sum y}{m}, \text{ so } 7.2 = \frac{\sum y}{30}
\]

\[
\sum y = 7.2 \times 30 = 216
\]

Mean = \[
\frac{160 + 216}{25 + 30} = 6.84 \text{ (3 s.f.)}
\]

You need to decide on the best measure to use in particular situations.

- **Mode** This is used when data are qualitative, or when quantitative with either a single mode or two modes (bimodal). There is no mode if each value occurs just once.
- **Median** This is used for quantitative data. It is usually used when there are extreme values, as they do not affect it as much as they affect the mean.
- **Mean** This is used for quantitative data and uses all the pieces of data. It therefore gives a true measure of the data. However, it is affected by extreme values.
You can calculate the mean and median for discrete data presented in a frequency table.

- For data given in a frequency table, the mean can be calculated using the formula
  \[
  \bar{x} = \frac{\sum xf}{\sum f}
  \]
  - \( \sum xf \) is the sum of the products of the data values and their frequencies.
  - \( \sum f \) is the sum of the frequencies.

**Example 4**

Li Wei records the shirt collar size, \( x \), of the male students in his year. The results are shown in the table.

For these data, find:

a. the mode
b. the median
c. the mean.

d. Explain why a shirt manufacturer might use the mode when planning production numbers.

**Solution**

<table>
<thead>
<tr>
<th>Shirt collar size</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>3</td>
</tr>
<tr>
<td>15.5</td>
<td>17</td>
</tr>
<tr>
<td>16</td>
<td>29</td>
</tr>
<tr>
<td>16.5</td>
<td>34</td>
</tr>
<tr>
<td>17</td>
<td>12</td>
</tr>
</tbody>
</table>

a. Mode = 16.5

b. There are 95 observations
   so the median is the \( \frac{95 + 1}{2} = 48 \)th.
   There are 20 observations up to 15.5
   and 49 observations up to 16.
   Median = 16

c. \[
  \bar{x} = \frac{15 \times 3 + 15.5 \times 17 + 16 \times 29 + 16.5 \times 34 + 17 \times 12}{95}
  \]
   \[
  = \frac{45 + 263.5 + 464 + 561 + 204}{95}
  \]
   \[
  = \frac{1537.5}{95}
  \]
   \[
  = 16.2
  \]

d. The mode is an actual data value and gives the manufacturer information on the most common size worn/purchased.

16.5 is the collar size with the highest frequency.

The 48th observation is therefore 16.

The mean is not one of the data values and the median is not necessarily indicative of the most popular collar size.

**Exercise 2B**

Priyanka collected wild mushrooms every day for a week. When she got home each day she weighed them to the nearest 100 g. The weights are shown below:

500 700 400 300 900 700 700

a. Write down the mode for these data.
b. Calculate the mean for these data.
c. Find the median for these data.

On the next day, Priyanka collected 650 g of wild mushrooms.
d. Write down the effect this will have on the mean, the mode and the median.

**Hint**

Try to answer part d without recalculating the averages. You could recalculate to check your answer.
2 Taha collects six pieces of data, \(x_1, x_2, x_3, x_4, x_5\) and \(x_6\). He works out that \(\Sigma x\) is 256.2

a Calculate the mean for these data.

b Taha collects another piece of data. It is 52.

c Write down the effect this piece of data will have on the mean.

3 The daily mean visibility, \(v\) metres, for Kuala Lumpur in May and June was recorded each day. The data are summarised as follows:

May: \(n = 31, \Sigma v = 724,000\)
June: \(n = 30, \Sigma v = 632,000\)

a Calculate the mean visibility in each month.

b Calculate the mean visibility for the total recording period.

4 A small workshop records how long it takes, in minutes, for each of their workers to make a certain item. The times are shown in the table.

<table>
<thead>
<tr>
<th>Worker</th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
<th>F</th>
<th>G</th>
<th>H</th>
<th>I</th>
<th>J</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time in minutes</td>
<td>7</td>
<td>12</td>
<td>10</td>
<td>8</td>
<td>6</td>
<td>8</td>
<td>5</td>
<td>26</td>
<td>11</td>
<td>9</td>
</tr>
</tbody>
</table>

a Write down the mode for these data.

b Calculate the mean for these data.

c Find the median for these data.

d The manager wants to give the workers an idea of the average time they took.

Write down, with a reason, which of the answers to a, b and c she should use.

5 The frequency table shows the number of breakdowns, \(b\), per month recorded by a lorry firm over a certain period of time.

Breakdowns | 0 | 1 | 2 | 3 | 4 | 5 |
---|---|---|---|---|---|---|
Frequency | 8 | 11 | 12 | 3 | 1 | 1 |

a Write down the modal number of breakdowns.

b Find the median number of breakdowns.

c Calculate the mean number of breakdowns.

d In a brochure about how many loads reach their destination on time, the firm quotes one of the answers to a, b or c as the number of breakdowns per month for its vehicles.

Write down which of the three answers the firm should quote in the brochure.

6 The table shows the frequency distribution for the number of petals in the flowers of a group of celandines.

<table>
<thead>
<tr>
<th>Number of petals</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>8</td>
<td>57</td>
<td>29</td>
<td>3</td>
<td>1</td>
</tr>
</tbody>
</table>

Calculate the mean number of petals.

7 A scientist is investigating how many eggs the endangered kakapo bird lays in each brood cycle. The results are given in this frequency table.

<table>
<thead>
<tr>
<th>Number of eggs</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>7</td>
<td>(p)</td>
<td>2</td>
</tr>
</tbody>
</table>

If the mean number of eggs is 1.5, find the value of \(p\).
You can calculate the mean, the class containing the median, and the modal class for continuous data presented in a grouped frequency table by finding the midpoint of each class interval.

**Example 5**

The length, \( x \) mm, to the nearest mm, of a random sample of pine cones is measured. The data are shown in the table.

<table>
<thead>
<tr>
<th>Length of pine cone (mm)</th>
<th>30–31</th>
<th>32–33</th>
<th>34–36</th>
<th>37–39</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>2</td>
<td>25</td>
<td>30</td>
<td>13</td>
</tr>
</tbody>
</table>

a) Write down the modal class.  
b) **Estimate** the mean.  
c) Find the median class.

**Solution:**

a) **Modal class** = 34–36

b) **Mean** = \( \frac{30.5 \times 2 + 32.5 \times 25 + 35 \times 30 + 38 \times 13}{70} \) = 34.54

c) There are 70 observations so the median is the 35.5th. The 35.5th observation will lie in the class 34–36.

**Exercise 2C**

1. The weekly wages (to the nearest €) of the production line workers in a small factory are shown in the table.

<table>
<thead>
<tr>
<th>Weekly wage (€)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>175–225</td>
<td>4</td>
</tr>
<tr>
<td>226–300</td>
<td>8</td>
</tr>
<tr>
<td>301–350</td>
<td>18</td>
</tr>
<tr>
<td>351–400</td>
<td>28</td>
</tr>
<tr>
<td>401–500</td>
<td>7</td>
</tr>
</tbody>
</table>

a) Write down the modal class.  
b) Calculate an estimate of the mean wage.  
c) Write down the interval containing the median.

2. The noise levels at 30 locations near an outdoor concert venue were measured to the nearest decibel. The data collected are shown in the grouped frequency table.

<table>
<thead>
<tr>
<th>Noise (decibels)</th>
<th>65–69</th>
<th>70–74</th>
<th>75–79</th>
<th>80–84</th>
<th>85–89</th>
<th>90–94</th>
<th>95–99</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>1</td>
<td>4</td>
<td>6</td>
<td>6</td>
<td>8</td>
<td>4</td>
<td>1</td>
</tr>
</tbody>
</table>

a) Calculate an estimate of the mean noise level.  
b) Explain why your answer to part a is an estimate.

3. The table shows the daily mean temperatures in Addis Ababa for the 30 days of June one year.

<table>
<thead>
<tr>
<th>Temperature (°C)</th>
<th>8 ≤ t &lt; 10</th>
<th>10 ≤ t &lt; 12</th>
<th>12 ≤ t &lt; 14</th>
<th>14 ≤ t &lt; 16</th>
<th>16 ≤ t &lt; 18</th>
<th>18 ≤ t &lt; 20</th>
<th>20 ≤ t &lt; 22</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>1</td>
<td>2</td>
<td>4</td>
<td>4</td>
<td>10</td>
<td>4</td>
<td>5</td>
</tr>
</tbody>
</table>

a) Write down the modal class.  
b) Calculate an estimate for the mean daily mean temperature.
Two shops (A and B) recorded the ages of their workers.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency A</td>
<td>5</td>
<td>16</td>
<td>14</td>
<td>22</td>
<td>26</td>
<td>14</td>
</tr>
<tr>
<td>Frequency B</td>
<td>4</td>
<td>12</td>
<td>10</td>
<td>28</td>
<td>25</td>
<td>13</td>
</tr>
</tbody>
</table>

By comparing estimated means for each shop, determine which shop is better at employing older workers.

2.3 Other measures of location

The median describes the middle of the data set. It splits the data set into two equal (50%) halves. You can calculate other measures of location such as quartiles and percentiles.

- The lower quartile is one-quarter of the way through the data set.
- The upper quartile is three-quarters of the way through the data set.
- Percentiles split the data set into 100 parts. The 10th percentile lies one-tenth of the way through the data.

Use these rules to find the upper and lower quartiles for discrete data.

- To find the lower quartile for discrete data, divide \( n \) by 4. If this is a whole number, the lower quartile is halfway between this data point and the one above. If it is not a whole number, round up and pick this data point.
- To find the upper quartile for discrete data, find \( \frac{3}{4} \) of \( n \). If this is a whole number, the upper quartile is halfway between this data point and the one above. If it is not a whole number, round up and pick this data point.

Example 6

The data below shows how far (in kilometres) 20 employees live from their place of work.

| 1 3 3 3 4 4 6 7 7 7 9 10 11 11 12 13 14 16 18 23 |

Find the median and quartiles for these data.
When data are presented in a grouped frequency table you can use a technique called interpolation to estimate the median, quartiles and percentiles. When you use interpolation, you are assuming that the data values are evenly distributed within each class.

Example 7

The length of time (to the nearest minute) spent on the internet each evening by a group of students is shown in the table.

<table>
<thead>
<tr>
<th>Time spent on the internet (minutes)</th>
<th>30–31</th>
<th>32–33</th>
<th>34–36</th>
<th>37–39</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>2</td>
<td>25</td>
<td>30</td>
<td>13</td>
</tr>
</tbody>
</table>

a Find an estimate for the upper quartile.

Using interpolation:

\[
\frac{3 \times 70}{4} = 52.5\text{th value}
\]

Q_3 = 52.5th value

\[
Q_3 = 36.05
\]

b The 10th percentile is the 7th data value.

\[
\frac{P_{10} - 31.5}{33.5 - 31.5} = \frac{7 - 2}{27 - 2}
\]

\[
P_{10} = 31.9
\]
1. The daily mean pressure (hPa) during the last 16 days of July in Perth is recorded. The data are given below:

1024 1022 1021 1019 1018 1017 1017 1018 1024 1027 1029 1031 1025 1017 1019 1014

a. Find the median pressure for that period.
b. Find the lower and upper quartiles.

2. Zaynep records the number of books in the collections of students in her year. The results are in the table below.

<table>
<thead>
<tr>
<th>Number of books</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>35</td>
<td>3</td>
</tr>
<tr>
<td>36</td>
<td>17</td>
</tr>
<tr>
<td>37</td>
<td>29</td>
</tr>
<tr>
<td>38</td>
<td>34</td>
</tr>
<tr>
<td>39</td>
<td>12</td>
</tr>
</tbody>
</table>

Find Q₁, Q₂ and Q₃.

3. A hotel is worried about the reliability of its lift. It keeps a weekly record of the number of times it breaks down over a period of 26 weeks. The data collected are summarised in the table opposite.

Use interpolation to estimate the median number of breakdowns.

4. The weights of 31 cows were recorded to the nearest kilogram. The weights are shown in the table.

<table>
<thead>
<tr>
<th>Weight of cow (kg)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>300–349</td>
<td>3</td>
</tr>
<tr>
<td>350–399</td>
<td>6</td>
</tr>
<tr>
<td>400–449</td>
<td>10</td>
</tr>
<tr>
<td>450–499</td>
<td>7</td>
</tr>
<tr>
<td>500–549</td>
<td>5</td>
</tr>
</tbody>
</table>

a. Find an estimate for the median weight.
b. Find the lower quartile, Q₁.
c. Find the upper quartile, Q₃.
d. Interpret the meaning of the value you have found for the upper quartile in part c.

5. A roadside assistance company kept a record over a week of the amount of time, in minutes, people were kept waiting for assistance. The times are shown below.

<table>
<thead>
<tr>
<th>Time waiting, t (minutes)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>20 ≤ t &lt; 30</td>
<td>6</td>
</tr>
<tr>
<td>30 ≤ t &lt; 40</td>
<td>10</td>
</tr>
<tr>
<td>40 ≤ t &lt; 50</td>
<td>18</td>
</tr>
<tr>
<td>50 ≤ t &lt; 60</td>
<td>13</td>
</tr>
<tr>
<td>60 ≤ t &lt; 70</td>
<td>2</td>
</tr>
</tbody>
</table>

a. Find an estimate for the mean time spent waiting. (1 mark)
b. Calculate the 65th percentile. (2 marks)

The firm writes the following statement for an advertisement:

Only 10% of our customers have to wait longer than 56 minutes.

c. By calculating a suitable percentile, comment on the validity of this claim. (3 marks)
6 The table shows the recorded wingspans, in metres, of 100 endangered California condor birds.

<table>
<thead>
<tr>
<th>Wingspan, w (m)</th>
<th>1.0 ≤ w &lt; 1.5</th>
<th>1.5 ≤ w &lt; 2.0</th>
<th>2.0 ≤ w &lt; 2.5</th>
<th>2.5 ≤ w &lt; 3.0</th>
<th>3.0 ≤ w</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>4</td>
<td>20</td>
<td>37</td>
<td>28</td>
<td>11</td>
</tr>
</tbody>
</table>

a Estimate the 80th percentile and interpret the value. 

(3 marks)

b State why it is not possible to estimate the 90th percentile. 

(1 mark)

2.4 Measures of spread

A measure of spread is a measure of how spread out the data are. Here are two simple measures of spread.

- The **range** is the difference between the largest and smallest values in the data set.
- The **interquartile range** (IQR) is the difference between the upper quartile and the lower quartile, \( Q_3 - Q_1 \).

The range takes into account all of the data but can be affected by extreme values. The interquartile range is not affected by extreme values but only considers the spread of the middle 50% of the data.

- The **interpercentile range** is the difference between the values for two given percentiles.

The 10th to 90th interpercentile range is often used since it is not affected by extreme values but still considers 80% of the data in its calculation.

**Example 8**

The table shows the masses, in tonnes, of 120 African bush elephants.

<table>
<thead>
<tr>
<th>Mass, m (tonnes)</th>
<th>4.0 ≤ m &lt; 4.5</th>
<th>4.5 ≤ m &lt; 5.0</th>
<th>5.0 ≤ m &lt; 5.5</th>
<th>5.5 ≤ m &lt; 6.0</th>
<th>6.0 ≤ m &lt; 6.5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>13</td>
<td>23</td>
<td>31</td>
<td>34</td>
<td>19</td>
</tr>
</tbody>
</table>

Find estimates for:

a the range 
b the interquartile range 
c the 10th to 90th interpercentile range.

a Range is 6.5 - 4.0 = 2.5 tonnes

b \( Q_1 \) = 30th data value: 4.87 tonnes
   \( Q_3 \) = 90th data value: 5.64 tonnes
   The interquartile range is therefore 5.64 - 4.87 = 0.97 tonnes

c 10th percentile = 12th data value: 4.46 tonnes
   90th percentile = 108th data value: 6.18 tonnes
   The 10th to 90th interpercentile range is therefore 6.18 - 4.46 = 1.72 tonnes

The largest possible value is 6.5 and the smallest possible value is 4.0.

Use interpolation:

\[
\frac{Q_3 - 4.5}{5.0 - 4.5} = \frac{30 - 13}{23}
\]

Use interpolation:

\[
\frac{Q_3 - 5.5}{6.0 - 5.5} = \frac{90 - 67}{34}
\]

Use interpolation to find the 10th and 90th percentiles, then work out the difference between them.
1. The lengths of a number of slow worms were measured, to the nearest mm. The results are shown in the table.
   a. Work out how many slow worms were measured.
   b. Estimate the interquartile range for the lengths of the slow worms.
   c. Calculate an estimate for the mean length of the slow worms.
   d. Estimate the number of slow worms whose length is more than one interquartile range above the mean.

2. The table shows the monthly income for workers in a factory.

<table>
<thead>
<tr>
<th>Monthly income, $ (x)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>900 ≤ x &lt; 1000</td>
<td>3</td>
</tr>
<tr>
<td>1000 ≤ x &lt; 1100</td>
<td>24</td>
</tr>
<tr>
<td>1100 ≤ x &lt; 1200</td>
<td>28</td>
</tr>
<tr>
<td>1200 ≤ x &lt; 1300</td>
<td>15</td>
</tr>
</tbody>
</table>

   a. Calculate the 34% to 66% interpercentile range.
   b. Estimate the number of data values that fall within this range.

3. A train travelled from Manchester to Liverpool. The times, to the nearest minute, it took for the journey were recorded over a certain period. The times are shown in the table.

<table>
<thead>
<tr>
<th>Journey time (minutes)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>15–16</td>
<td>5</td>
</tr>
<tr>
<td>17–18</td>
<td>10</td>
</tr>
<tr>
<td>19–20</td>
<td>35</td>
</tr>
<tr>
<td>21–22</td>
<td>10</td>
</tr>
</tbody>
</table>

   a. Calculate the 5% to 95% interpercentile range.
   b. Estimate the number of data values that fall within this range.

4. The daily mean temperature (°C) in Santiago for each of the first ten days of June is given below:

<table>
<thead>
<tr>
<th>Temperature (°C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>14.3 12.7 12.4 10.9 9.4 13.2 12.1 10.3 10.3 10.6</td>
</tr>
</tbody>
</table>

   a. Calculate the median and interquartile range.
   b. Compare the data for May with the data for June.
   c. Estimate the number of days in July on which the daily mean temperature fell within this range.
2.5 Variance and standard deviation

Another measure that can be used to work out the spread of a data set is the **variance**. This makes use of the fact that each data point deviates from the mean by the amount \( x - \bar{x} \).

\[
\text{Variance} = \frac{\sum (x - \bar{x})^2}{n} = \frac{\sum x^2}{n} - \left( \frac{\sum x}{n} \right)^2 = S_{xx}
\]

where \( S_{xx} = \sum (x - \bar{x})^2 = \sum x^2 - \left( \frac{\sum x}{n} \right)^2 \)

The second version of the formula, \( \frac{\sum x^2}{n} - \left( \frac{\sum x}{n} \right)^2 \), is easier to work with when given raw data. It can be thought of as ‘the mean of the squares minus the square of the mean’.

The third version, \( \frac{S_{xx}}{n} \), is easier to use if you can use your calculator to find \( S_{xx} \) quickly.

The units of the variance are the units of the data squared. You can find a related measure of spread that has the same units as the data.

- **The standard deviation** is the square root of the variance:

\[
\sigma = \sqrt{\frac{\sum (x - \bar{x})^2}{n}} = \sqrt{\frac{\sum x^2}{n} - \left( \frac{\sum x}{n} \right)^2} = \sqrt{\frac{S_{xx}}{n}}
\]

**Example 9**

The marks gained in a test by seven randomly selected students are:

\[3 \quad 4 \quad 6 \quad 2 \quad 8 \quad 8 \quad 5\]

Find the variance and standard deviation of the marks of the seven students.

\[
\Sigma x = 3 + 4 + 6 + 2 + 8 + 8 + 5 = 36
\]
\[
\Sigma x^2 = 9 + 16 + 36 + 4 + 64 + 64 + 25 = 218
\]

**variance, \( \sigma^2 = \frac{218}{7} - \left( \frac{36}{7} \right)^2 = 4.69 \)**

**standard deviation, \( \sigma = \sqrt{4.69} = 2.17 \)**

You can use these versions of the formulae for variance and standard deviation for grouped data that is presented in a frequency table:

- \( \sigma^2 = \frac{\Sigma f(x - \bar{x})^2}{\Sigma f} = \frac{\Sigma fx^2}{\Sigma f} - \left( \frac{\Sigma fx}{\Sigma f} \right)^2 \)

- \( \sigma = \sqrt{\frac{\Sigma f(x - \bar{x})^2}{\Sigma f}} = \sqrt{\frac{\Sigma fx^2}{\Sigma f} - \left( \frac{\Sigma fx}{\Sigma f} \right)^2} \)

where \( f \) is the frequency for each group and \( \Sigma f \) is the total frequency.
Shamsa records the time spent out of school during the lunch hour to the nearest minute, \( x \), of the students in her year. The results are shown in the table. Calculate the standard deviation of the time spent out of school.

\[
\begin{align*}
\Sigma fx^2 &= 3 \times 35^2 + 17 \times 36^2 + 29 \times 37^2 \\
&\quad + 34 \times 38^2 = 114504 \\
\Sigma fx &= 3 \times 35 + 17 \times 36 + 29 \times 37 \\
&\quad + 34 \times 38 = 3062 \\
\Sigma f &= 3 + 17 + 29 + 34 = 83 \\
\sigma^2 &= \frac{\Sigma fx^2}{\Sigma f} - \left( \frac{\Sigma fx}{\Sigma f} \right)^2 \\
&= \frac{114504}{83} - \left( \frac{3062}{83} \right)^2 = 0.74147... \\
\sigma &= \sqrt{0.74147...} = 0.861 \text{ (3 s.f.)}
\end{align*}
\]

If the data are given in a grouped frequency table, you can calculate estimates for the variance and standard deviation of the data using the midpoint of each class interval.

Akira recorded the length, in minutes, of each phone call she made for a month. The data are summarised in the table below.

<table>
<thead>
<tr>
<th>Length of phone call, ( l ) (min)</th>
<th>Frequency</th>
<th>Midpoint ( x )</th>
<th>( fx )</th>
<th>( fx^2 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( 0 &lt; l \leq 5 )</td>
<td>4</td>
<td>2.5</td>
<td>4 \times 2.5 = 10</td>
<td>4 \times 6.25 = 25</td>
</tr>
<tr>
<td>( 5 &lt; l \leq 10 )</td>
<td>15</td>
<td>7.5</td>
<td>112.5</td>
<td>843.75</td>
</tr>
<tr>
<td>( 10 &lt; l \leq 15 )</td>
<td>5</td>
<td>12.5</td>
<td>62.5</td>
<td>781.25</td>
</tr>
<tr>
<td>( 15 &lt; l \leq 20 )</td>
<td>2</td>
<td>17.5</td>
<td>35</td>
<td>612.5</td>
</tr>
<tr>
<td>( 20 &lt; l \leq 60 )</td>
<td>0</td>
<td>40</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>( 60 &lt; l \leq 70 )</td>
<td>1</td>
<td>65</td>
<td>65</td>
<td>4225</td>
</tr>
<tr>
<td><strong>total</strong></td>
<td><strong>27</strong></td>
<td><strong>285</strong></td>
<td><strong>6487.5</strong></td>
<td><strong>6487.5</strong></td>
</tr>
</tbody>
</table>

\[
\begin{align*}
\Sigma fx^2 &= 6487.5 \\
\Sigma fx &= 285 \\
\Sigma f &= 27 \\
\sigma^2 &= \frac{\Sigma fx^2}{\Sigma f} - \left( \frac{\Sigma fx}{\Sigma f} \right)^2 \\
&= \frac{6487.5}{27} - \left( \frac{285}{27} \right)^2 = 128.85802 \\
\sigma &= \sqrt{128.85802} = 11.4 \text{ (3 s.f.)}
\end{align*}
\]
1 The summary data for a variable \( x \) are: \( \Sigma x = 24 \quad \Sigma x^2 = 78 \quad n = 8 \)
Find:
   a the mean
   b the variance \( \sigma^2 \)
   c the standard deviation \( \sigma \).

2 Ten collie dogs are weighed (\( w \) kg). The summary data for the weights are:
   \( \Sigma w = 241 \quad \Sigma w^2 = 5905 \)
Use this summary data to find the standard deviation of the collies’ weights. (2 marks)

3 Eight students’ heights (\( h \) cm) are measured. They are as follows:
   165 170 190 180 175 185 176 184
   a Work out the mean height of the students.
   b Given \( \Sigma h^2 = 254307 \), work out the variance. Show all your working.
   c Work out the standard deviation.

4 For a set of 10 numbers: \( \Sigma x = 50 \quad \Sigma x^2 = 310 \)
   For a different set of 15 numbers: \( \Sigma x = 86 \quad \Sigma x^2 = 568 \)
Find the mean and the standard deviation of the combined set of 25 numbers.

5 Nahab asks the students in his year group how much allowance they get per week. The results, rounded to the nearest Omani Riyals, are shown in the table.

<table>
<thead>
<tr>
<th>Number of OMR</th>
<th>8</th>
<th>9</th>
<th>10</th>
<th>11</th>
<th>12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>14</td>
<td>8</td>
<td>28</td>
<td>15</td>
<td>20</td>
</tr>
</tbody>
</table>

   a Work out the mean and standard deviation of the allowance. Give units with your answer. (3 marks)
   b How many students received an allowance amount more than one standard deviation above the mean? (2 marks)

6 In a student group, a record was kept of the number of days of absence each student had over one particular term. The results are shown in the table.

<table>
<thead>
<tr>
<th>Number of days absent</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>12</td>
<td>20</td>
<td>10</td>
<td>7</td>
<td>5</td>
</tr>
</tbody>
</table>

Work out the standard deviation of the number of days absent. (2 marks)
7 A certain type of machine contained a part that tended to wear out after different amounts of time. The time it took for 50 of the parts to wear out was recorded. The results are shown in the table.

<table>
<thead>
<tr>
<th>Lifetime, ( h ) (hours)</th>
<th>5 &lt; ( h ) ≤ 10</th>
<th>10 &lt; ( h ) ≤ 15</th>
<th>15 &lt; ( h ) ≤ 20</th>
<th>20 &lt; ( h ) ≤ 25</th>
<th>25 &lt; ( h ) ≤ 30</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>5</td>
<td>14</td>
<td>23</td>
<td>6</td>
<td>2</td>
</tr>
</tbody>
</table>

The manufacturer makes the following claim:

90\% of the parts tested lasted longer than one standard deviation below the mean.

Comment on the accuracy of the manufacturer’s claim, giving relevant numerical evidence.

8 The daily mean wind speed, \( x \) (knots) in Chicago is recorded. The summary data are:

\( \Sigma x = 243 \quad \Sigma x^2 = 2317 \)

a Work out the mean and the standard deviation of the daily mean wind speed.

The highest recorded wind speed was 17 knots and the lowest recorded wind speed was 4 knots.

b Estimate the number of days in which the wind speed was greater than one standard deviation above the mean.

c State one assumption you have made in making this estimate.

2.6 Coding

Coding is a way of simplifying statistical calculations. Each data value is coded to make a new set of data values which are easier to work with.

In your exam, you will usually have to code values using a formula like this: \( y = \frac{x - a}{b} \)

where \( a \) and \( b \) are constants that you have to choose, or are given with the question.

When data are coded, different statistics change in different ways.

- If data are coded using the formula \( y = \frac{x - a}{b} \)
  - the mean of the coded data is given by \( \bar{y} = \frac{\bar{x} - a}{b} \)
  - the standard deviation of the coded data is given by \( \sigma_y = \frac{\sigma_x}{b} \), where \( \sigma_x \) is the standard deviation of the original data.

Hint You usually need to find the mean and standard deviation of the original data given the statistics for the coded data. You can rearrange the formulae as:

- \( \bar{x} = b\bar{y} + a \)
- \( \sigma_x = b\sigma_y \)
Example 12 <SKILLS INTERPRETATION>

A scientist measures the temperature, $x^\circ C$, at five different points in a nuclear reactor. Her results are given below:

$$332^\circ C\quad 355^\circ C\quad 306^\circ C\quad 317^\circ C\quad 340^\circ C$$

a Use the coding $y = \frac{x - 300}{10}$ to code these data.

b Calculate the mean and standard deviation of the coded data.

c Use your answer to part b to calculate the mean and standard deviation of the original data.

<table>
<thead>
<tr>
<th>Original data, $x$</th>
<th>332</th>
<th>355</th>
<th>306</th>
<th>317</th>
<th>340</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coded data, $y$</td>
<td>3.2</td>
<td>5.5</td>
<td>0.6</td>
<td>1.7</td>
<td>4.0</td>
</tr>
</tbody>
</table>

When $x = 332$, $y = \frac{332 - 300}{10} = 3.2$

Substitute into $\bar{y} = \frac{\bar{x} - a}{b}$ and solve to find $\bar{x}$.

You could also use $\bar{x} = b \bar{y} + a$ with $a = 300$, $b = 10$ and $\bar{y} = 3$.

Substitute into $\sigma_y = \frac{\sigma_x}{b}$ and solve to find $\sigma_x$.

You could also use $\sigma_x = b \sigma_y$ with $\sigma_y = 1.72$ and $b = 10$.

Example 13 <SKILLS INTERPRETATION>

Data on the maximum gust, $g$ knots, are recorded in Chicago during May and June. The data were coded using $h = \frac{g - 5}{10}$ and the following statistics found:

$$S_{hh} = 43.58 \quad \bar{h} = 2 \quad n = 61$$

Calculate the mean and standard deviation of the maximum gust in knots.

$$2 = \frac{\bar{h} - 5}{10}$$

$g = 2 \times 10 + 5 = 25$ knots

$$\sigma_h = \sqrt{\frac{43.58}{61}} = 0.845$$

$$\bar{h} = \frac{\sigma_g}{b}$$

$$\sigma_g = \sigma_h \times 10 = 8.45$ knots (3 s.f.)

Use the formula for the mean of a coded variable: $\bar{h} = \frac{g - a}{b}$ with $a = 5$ and $b = 10$.

Calculate the standard deviation of the coded data using $\sigma_h = \sqrt{\frac{S_{hh}}{n}}$, then use the formula for the standard deviation of a coded variable: $\sigma_g = \frac{\sigma_h}{b}$ with $b = 10$. 
Example 14

As seen in Example 11, Akira recorded the length, in minutes, of each phone call she made for a month, as summarised in the table below. This example will now show you how to solve this type of question with a different method.

Use \( y = \frac{x - 7.5}{5} \) to calculate an estimate for:

a) the mean
b) the standard deviation.

<table>
<thead>
<tr>
<th>Length of phone call</th>
<th>Number of occasions</th>
<th>Midpoint ( x )</th>
<th>( y = \frac{x - 7.5}{5} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 &lt; ( l ) ≤ 5</td>
<td>4</td>
<td>2.5</td>
<td>-1</td>
</tr>
<tr>
<td>5 &lt; ( l ) ≤ 10</td>
<td>15</td>
<td>7.5</td>
<td>0</td>
</tr>
<tr>
<td>10 &lt; ( l ) ≤ 15</td>
<td>5</td>
<td>12.5</td>
<td>1</td>
</tr>
<tr>
<td>15 &lt; ( l ) ≤ 20</td>
<td>2</td>
<td>17.5</td>
<td>2</td>
</tr>
<tr>
<td>20 &lt; ( l ) ≤ 60</td>
<td>0</td>
<td>40</td>
<td>0</td>
</tr>
<tr>
<td>60 &lt; ( l ) ≤ 70</td>
<td>1</td>
<td>65</td>
<td>11.5</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>27</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Mean of coded data:

\[
\bar{y} = \frac{16.5}{27} = 0.6111
\]

Mean of original data:

\[
\bar{x} = 0.6111 \times 5 = \frac{x - 7.5}{5} \times 5 = x - 7.5
\]

\[
x = 10.56
\]

<table>
<thead>
<tr>
<th>Length of phone call</th>
<th>Number of occasions</th>
<th>Midpoint ( x )</th>
<th>( y = \frac{x - 7.5}{5} )</th>
<th>( f_y )</th>
<th>( f_y^2 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 &lt; ( l ) ≤ 5</td>
<td>4</td>
<td>2.5</td>
<td>-1</td>
<td>-4</td>
<td>4</td>
</tr>
<tr>
<td>5 &lt; ( l ) ≤ 10</td>
<td>15</td>
<td>7.5</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>10 &lt; ( l ) ≤ 15</td>
<td>5</td>
<td>12.5</td>
<td>1</td>
<td>5</td>
<td>5</td>
</tr>
<tr>
<td>15 &lt; ( l ) ≤ 20</td>
<td>2</td>
<td>17.5</td>
<td>2</td>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>20 &lt; ( l ) ≤ 60</td>
<td>0</td>
<td>40</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>60 &lt; ( l ) ≤ 70</td>
<td>1</td>
<td>65</td>
<td>11.5</td>
<td>11.5</td>
<td>132.25</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>27</strong></td>
<td></td>
<td></td>
<td><strong>16.5</strong></td>
<td><strong>149.25</strong></td>
</tr>
</tbody>
</table>

Standard deviation of coded data:

\[
\sigma_y = \sqrt{\frac{149.25}{27} - \left(\frac{16.5}{27}\right)^2} = 2.27
\]

Standard deviation of original data:

\[
\sigma_x = 2.27 \times 5 = 11.35
\]
Exercise 2G

1. A set of data values, \( x \), is shown below:
   \[
   110 \quad 90 \quad 50 \quad 80 \quad 30 \quad 70 \quad 60
   \]
   a. Code the data using the coding \( y = \frac{x}{10} \).
   b. Calculate the mean of the coded data values.
   c. Use your answer to part b to calculate the mean of the original data.

2. A set of data values, \( x \), is shown below:
   \[
   52 \quad 73 \quad 31 \quad 73 \quad 38 \quad 80 \quad 17 \quad 24
   \]
   a. Code the data using the coding \( y = \frac{x - 3}{7} \).
   b. Calculate the mean of the coded data values.
   c. Use your answer to part b to calculate the mean of the original data.

3. The coded mean price of televisions in a shop was worked out. Using the coding \( y = \frac{x - 65}{200} \) the mean price was 1.5. Find the true mean price of the televisions.

4. The coding \( y = x - 40 \) gives a standard deviation for \( y \) of 2.34. Write down the standard deviation of \( x \).

5. A study was performed to investigate how long a mobile phone battery lasts if the phone is not used. The grouped frequency table shows the battery life (\( b \) hours) of a random sample of 100 different mobile phones.

<table>
<thead>
<tr>
<th>Battery life (( b ) hours)</th>
<th>Frequency (( f ))</th>
<th>Midpoint (( x ))</th>
<th>( y = \frac{x - 14}{2} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>11–21</td>
<td>11</td>
<td>11</td>
<td></td>
</tr>
<tr>
<td>21–27</td>
<td>24</td>
<td>24</td>
<td></td>
</tr>
<tr>
<td>27–31</td>
<td>27</td>
<td>27</td>
<td></td>
</tr>
<tr>
<td>31–37</td>
<td>26</td>
<td>32</td>
<td></td>
</tr>
<tr>
<td>37–43</td>
<td>12</td>
<td>39.5</td>
<td></td>
</tr>
</tbody>
</table>

   a. Copy and complete the table.
   b. Use the coding \( y = \frac{x - 14}{2} \) to calculate an estimate of the mean battery life.

6. The lifetime, \( x \), in hours, of 70 light bulbs is shown in the table below.

<table>
<thead>
<tr>
<th>Lifetime, ( x ) (hours)</th>
<th>20 &lt; ( x ) ≤ 22</th>
<th>22 &lt; ( x ) ≤ 24</th>
<th>24 &lt; ( x ) ≤ 26</th>
<th>26 &lt; ( x ) ≤ 28</th>
<th>28 &lt; ( x ) ≤ 30</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>3</td>
<td>12</td>
<td>40</td>
<td>10</td>
<td>5</td>
</tr>
</tbody>
</table>

   The data are coded using \( y = \frac{x - 1}{20} \).

   a. Estimate the mean of the coded values \( \bar{y} \).
   b. Hence find an estimate for the mean lifetime of the light bulbs, \( \bar{x} \).
   c. Estimate the standard deviation of the lifetimes of the light bulbs.

Watch out: Adding or subtracting constants does not affect how spread out the data are, so you can ignore the ‘−40’ when finding the standard deviation for \( x \).
7 The weekly income, \( i \), of 100 workers was recorded. The data were coded using \( y = \frac{i - 90}{100} \) and the following summations were obtained:
\[
\Sigma y = 131, \quad \Sigma y^2 = 176.84
\]
Estimate the standard deviation of the actual workers’ weekly income. (2 marks)

8 A meteorologist collected data on the annual rainfall, \( x \) mm, at six randomly selected places. The data were coded using \( s = 0.01x - 10 \) and the following summations were obtained:
\[
\Sigma s = 16.1, \quad \Sigma s^2 = 147.03
\]
Work out an estimate for the standard deviation of the actual annual rainfall. (2 marks)

9 The daily mean pressure, \( p \) hPa, in Accra during August is recorded. The data are coded using \( c = \frac{p}{2} - 500 \) and the following summary statistics were obtained:
\[
n = 30, \quad \bar{c} = 10.15, \quad S_{cc} = 296.4
\]
Find the mean and standard deviation of the daily mean pressure. (4 marks)

Chapter review 2

1 On a science test, the mean mark for a group of eight students is 65. The mean mark for a second group of 12 students is 72. Calculate the mean mark for the combined group of 20 students.

2 The data set below shows the prices \( x \) of six shares on a particular day in the year 2007:
\[
807 \quad 967 \quad 727 \quad 167 \quad 207 \quad 767
\]

a Code the data using the coding \( y = \frac{x - 7}{80} \)

b Calculate the mean of the coded data values.

c Use your answer to part b to calculate the mean of the original data.

3 Different teachers using different methods taught two groups of students. Both groups of students took the same examination at the end of the course. The students’ marks are shown in the grouped frequency table.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency group A</td>
<td>1</td>
<td>3</td>
<td>6</td>
<td>6</td>
<td>11</td>
<td>10</td>
<td>8</td>
</tr>
<tr>
<td>Frequency group B</td>
<td>1</td>
<td>2</td>
<td>4</td>
<td>13</td>
<td>15</td>
<td>6</td>
<td>3</td>
</tr>
</tbody>
</table>

a Work out an estimate of the mean mark for group A and an estimate of the mean mark for group B.

b Write down whether or not the answer to a suggests that one method of teaching is better than the other. Give a reason for your answer.
4 The lifetimes of 80 batteries, to the nearest hour, are shown in the table below.

<table>
<thead>
<tr>
<th>Lifetime (hours)</th>
<th>6–10</th>
<th>11–15</th>
<th>16–20</th>
<th>21–25</th>
<th>26–30</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>2</td>
<td>10</td>
<td>18</td>
<td>45</td>
<td>5</td>
</tr>
</tbody>
</table>

a Write down the modal class for the lifetime of the batteries.
b Use interpolation to find the median lifetime of the batteries.

The midpoint of each class is represented by $x$ and its corresponding frequency by $f$, giving $\sum fx = 1645$.
c Calculate an estimate of the mean lifetime of the batteries.

Another batch of 12 batteries is found to have an estimated mean lifetime of 22.3 hours.
d Estimate the mean lifetime for all 92 batteries.

5 A frequency distribution is shown below.

<table>
<thead>
<tr>
<th>Class interval</th>
<th>1–20</th>
<th>21–40</th>
<th>41–60</th>
<th>61–80</th>
<th>81–100</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>5</td>
<td>10</td>
<td>15</td>
<td>12</td>
<td>8</td>
</tr>
</tbody>
</table>

Use interpolation to find an estimate for the interquartile range.

6 A frequency distribution is shown below.

<table>
<thead>
<tr>
<th>Class interval</th>
<th>1–10</th>
<th>11–20</th>
<th>21–30</th>
<th>31–40</th>
<th>41–50</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>10</td>
<td>20</td>
<td>30</td>
<td>24</td>
<td>16</td>
</tr>
</tbody>
</table>

a Use interpolation to estimate the value of the 30th percentile.
b Use interpolation to estimate the value of the 70th percentile.
c Hence estimate the 30% to 70% interpercentile range.

7 The times it took a random sample of runners to complete a race are summarised in the table.

<table>
<thead>
<tr>
<th>Time taken, $t$ (minutes)</th>
<th>20–29</th>
<th>30–39</th>
<th>40–49</th>
<th>50–59</th>
<th>60–69</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>5</td>
<td>10</td>
<td>36</td>
<td>20</td>
<td>9</td>
</tr>
</tbody>
</table>

a Use interpolation to estimate the interquartile range. (3 marks)

The midpoint of each class was represented by $x$ and its corresponding frequency by $f$ giving:

$\sum fx = 3740 \quad \sum fx^2 = 183040$

b Estimate the variance and standard deviation for these data. (3 marks)

8 The heights of 50 clover flowers are summarised in the table.

<table>
<thead>
<tr>
<th>Height, $x$ (mm)</th>
<th>$90 &lt; x &lt; 95$</th>
<th>$95 \leq x &lt; 100$</th>
<th>$100 \leq x &lt; 105$</th>
<th>$105 \leq x &lt; 110$</th>
<th>$110 \leq x &lt; 115$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>5</td>
<td>10</td>
<td>26</td>
<td>8</td>
<td>1</td>
</tr>
</tbody>
</table>

a Find $Q_1$.
b Find $Q_2$.
c Find the interquartile range.
d Use $\sum fx = 5075$ and $\sum fx^2 = 516112.5$ to find the standard deviation.
9. The daily mean temperatures recorded in Dakar, Senegal, during September are shown in the table below.

<table>
<thead>
<tr>
<th>Temp (°C)</th>
<th>25 ≤ t &lt; 27</th>
<th>27 ≤ t &lt; 29</th>
<th>29 ≤ t &lt; 31</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>12</td>
<td>14</td>
<td>4</td>
</tr>
</tbody>
</table>

a. Estimate the mean and standard deviation of the temperatures. 

b. Use linear interpolation to find an estimate for the 10% to 90% interpercentile range.

c. Estimate the number of days in September when the daily mean temperature in Dakar is more than one standard deviation greater than the mean.

10. The daily mean wind speed, w knots, was recorded at Toronto Pearson International Airport, during May. The data were coded using \( z = \frac{w - 3}{2} \)

Summary statistics were calculated for the coded data:

\( n = 31 \quad \Sigma z = 106 \quad S_{zz} = 80.55 \)

a. Find the mean and standard deviation of the coded data.

b. Work out the mean and standard deviation of the daily mean wind speed at Toronto Pearson International Airport during May.

11. 20 endangered owls were caught for ringing (wrapping a label around their legs to help identify them). Their wingspans (x cm) were measured to the nearest centimetre.

The following summary statistics were worked out:

\( \Sigma x = 316 \quad \Sigma x^2 = 5078 \)

a. Work out the mean and the standard deviation of the wingspans of the 20 birds.

One more bird was caught. It had a wingspan of 13 centimetres.

b. Without doing any further calculation, say how you think this extra wingspan will affect the mean wingspan.

20 eagles were also caught for ringing. Their wingspans (y cm) were also measured to the nearest centimetre and the data coded using \( z = \frac{y - 5}{10} \)

The following summary statistics were obtained from the coded data:

\( \Sigma z = 104 \quad S_{zz} = 1.8 \)

c. Work out the mean and standard deviation of the wingspans of the eagles.

Challenge

A biologist recorded the heights, x cm, of 20 plant seedlings. She calculated the mean and standard deviation of her results:

\( \bar{x} = 3.1 \text{ cm} \quad \sigma = 1.4 \text{ cm} \)

The biologist subsequently discovered she had written down one value incorrectly. She replaced a value of 2.3 cm with a value of 3.2 cm.

Calculate the new mean and standard deviation of her data.
Summary of key points

1. The **mode** or **modal class** is the value or class that occurs most often.

2. The **median** is the middle value when the data values are put in order.

3. The **mean** can be calculated using the formula \( \bar{x} = \frac{\sum x}{n} \)

4. For data given in a frequency table, the mean can be calculated using the formula \( \bar{x} = \frac{\sum xf}{\sum f} \)

5. To find the **lower quartile** for discrete data, divide \( n \) by 4. If this is a whole number, the lower quartile is halfway between this data point and the one above. If it is not a whole number, round up and pick this data point.

6. To find the **upper quartile** for discrete data, find \( \frac{3}{4} \) of \( n \). If this is a whole number, the upper quartile is halfway between this data point and the one above. If it is not a whole number, round up and pick this data point.

7. The **range** is the difference between the largest and smallest values in a data set.

8. The **interquartile range** (IQR) is the difference between the upper quartile and the lower quartile, \( Q_3 - Q_1 \).

9. The **interpercentile range** is the difference between the values for two given percentiles.

10. **Variance** \( = \frac{\sum(x - \bar{x})^2}{n} = \frac{\sum x^2}{n} - \left( \frac{\sum x}{n} \right)^2 \) where \( S_{xx} = \sum(x - \bar{x})^2 = \sum x^2 - \frac{(\sum x)^2}{n} \)

11. The **standard deviation** is the square root of the variance:

\[
\sigma = \sqrt{\frac{\sum(x - \bar{x})^2}{n}} = \sqrt{\frac{\sum x^2}{n} - \left( \frac{\sum x}{n} \right)^2} = \sqrt{S_{xx}}/n
\]

12. You can use these versions of the formulae for variance and standard deviation for grouped data that is presented in a frequency table:

\[
\sigma^2 = \frac{\sum f(x - \bar{x})^2}{\sum f} = \frac{\sum f x^2}{\sum f} - \left( \frac{\sum f x}{\sum f} \right)^2
\]

\[
\sigma = \sqrt{\frac{\sum f(x - \bar{x})^2}{\sum f}} = \sqrt{\frac{\sum f x^2}{\sum f} - \left( \frac{\sum f x}{\sum f} \right)^2}
\]

where \( f \) is the frequency for each group and \( \sum f \) is the total frequency.

13. If data are coded using the formula \( y = \frac{x - a}{b} \)

- the mean of the coded data is given by \( \bar{y} = \frac{\bar{x} - a}{b} \)

- the standard deviation of the coded data is given by \( \sigma_y = \frac{\sigma_x}{b} \) where \( \sigma_x \) is the standard deviation of the original data.

14. If set \( A \), of size \( n_1 \), has mean \( \bar{x}_1 \), and set \( B \), of size \( n_2 \), has a mean \( \bar{x}_2 \), then the mean of the combined set of \( A \) and \( B \) is:

\[
\bar{x} = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}
\]
Visual representations can help to illustrate the key features of a data set without the need for complicated calculations. Graphs and charts are vital in many industries, from the financial sector to journalism. Graphs and charts help you to visualise complicated data, for example showing the different food groups.

1. The table shows the number of siblings for 60 students:

<table>
<thead>
<tr>
<th>Number of siblings</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>5</td>
</tr>
<tr>
<td>1</td>
<td>8</td>
</tr>
<tr>
<td>2</td>
<td>29</td>
</tr>
<tr>
<td>3</td>
<td>15</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
</tr>
</tbody>
</table>

Draw a pie chart to show the data.

2. Work out the interquartile range for this set of data: 3, 5, 8, 8, 9, 11, 14, 15, 18, 20, 21, 24

3. Work out the mean and standard deviation for this set of data: 17, 19, 20, 25, 28, 31, 32, 32, 35, 37, 38
3.1 Histograms

Grouped continuous data can be represented in a histogram.

Generally, a histogram gives a good picture of how the data are distributed. It enables you to see a rough location, the general shape and how spread out the data are.

In a histogram, the area of the bar is proportional (related in size) to the frequency in each class. This allows you to use a histogram to represent grouped data with unequal class intervals.

- In a histogram, to calculate the height of each bar (the frequency density) use the formula:
  \[ \text{area of bar} = k \times \text{frequency} \]
  where \( k = 1 \) is the easiest value to use when drawing a histogram.
  If \( k = 1 \), then
  \[ \text{frequency density} = \frac{\text{frequency}}{\text{class width}} \]

- Joining the middle of the top of each bar in a histogram forms a frequency polygon.

**Example 1**

In a random sample, 200 students were asked how long it took them to complete their homework the previous night. The times were recorded and summarised in the table below.

<table>
<thead>
<tr>
<th>Time, ( t ) (minutes)</th>
<th>25 ( \leq t &lt; 30 )</th>
<th>30 ( \leq t &lt; 35 )</th>
<th>35 ( \leq t &lt; 40 )</th>
<th>40 ( \leq t &lt; 50 )</th>
<th>50 ( \leq t &lt; 80 )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>55</td>
<td>39</td>
<td>68</td>
<td>32</td>
<td>6</td>
</tr>
</tbody>
</table>

a Draw a histogram and a frequency polygon to represent the data.

b Estimate how many students took between 36 and 45 minutes to complete their homework.

\[ \text{Frequency density} = \frac{55}{5} = 11 \]

\[ \text{Class width} = 30 - 25 = 5 \]
To draw the frequency polygon, join the middle of the top of each bar of the histogram.

To estimate the number of students who spent between 36 and 45 minutes, you need to find the area between 36 and 45.

Example 2

The histogram below displays the information gathered from 100 people, regarding how long, in minutes, they took to complete a word puzzle.

a Why should a histogram be used to represent these data?

b Write down the underlying feature associated with each of the bars in a histogram.

c Given that 5 people completed the puzzle between 2 and 3 minutes, find the number of people who completed the puzzle between 0 and 2 minutes.

\[ \text{Shaded area} = (40 - 36) \times 13.6 + (45 - 40) \times 3.2 = 70.4 \text{ students} \]
a Time is continuous, and continuous data can be represented in a histogram.

b The area of the bar is proportional to the frequency.

c There are 25 small squares between 2 and 3 minutes. Therefore, 25 small squares represents 5 people.

1 small square represents \( \frac{1}{5} \) of a person.

There are 20 small squares between 0 and 2 minutes. Thus, \( 20 \times \frac{1}{5} = 4 \) people.

Exercise 3A

1 The data in the table show the mass, in kilograms, of 50 adult puffer fish.

a Draw a histogram for these data.

b On the same set of axes, draw a frequency polygon.

<table>
<thead>
<tr>
<th>Mass, ( m ) (kg)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>( 10 \leq m &lt; 15 )</td>
<td>4</td>
</tr>
<tr>
<td>( 15 \leq m &lt; 20 )</td>
<td>12</td>
</tr>
<tr>
<td>( 20 \leq m &lt; 25 )</td>
<td>23</td>
</tr>
<tr>
<td>( 25 \leq m &lt; 30 )</td>
<td>8</td>
</tr>
<tr>
<td>( 30 \leq m &lt; 35 )</td>
<td>3</td>
</tr>
</tbody>
</table>

Some students took part in an obstacle race. The time for each student to complete the race was noted. The results are shown in the histogram.

a Give a reason to justify the use of a histogram to represent these data.

90 students took between 60 and 70 seconds to complete the race.

b Find the number of students who took between 40 and 60 seconds.

c Find the number of students who took 80 seconds or less.

d Calculate the total number of students who took part in the race.

Watch out Frequency density \( \times \) class width is always proportional to frequency in a histogram, but not necessarily equal to frequency.
3. A Fun Day committee at a local sports centre organised a tennis ball throwing competition. The distance thrown by every competitor was recorded and the data is shown in the histogram. Forty people threw the ball less than 20 m.

a Why is a histogram a suitable diagram to represent these data?
b How many people entered the competition?
c Estimate how many people threw between 30 and 40 metres.
d How many people threw between 45 and 65 metres?
e Estimate how many people threw less than 25 metres.

4. A farmer found the masses of a random sample of lambs. The masses were summarised in a grouped frequency table and represented by a histogram. The frequency for the class $28 < m \leq 32$ was 32.

a Show that 25 small squares on the histogram represents 8 lambs.
b Find the frequency of the $24 < m \leq 26$ class.
c How many lambs did the farmer weigh in total?
d Estimate the number of lambs that had masses between 25 and 29 kg.

**Problem-solving**

You can use area to solve histogram problems where no vertical scale is given. You could also use the information given in the question to work out a suitable scale for the vertical axis.
5 The partially (not entirely) completed histogram shows the time, in minutes, that passengers were delayed at an airport.

a i Copy and complete the table.

<table>
<thead>
<tr>
<th>Time, $t$ (min)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>$0 \leq t &lt; 20$</td>
<td>4</td>
</tr>
<tr>
<td>$20 \leq t &lt; 30$</td>
<td></td>
</tr>
<tr>
<td>$30 \leq t &lt; 35$</td>
<td>15</td>
</tr>
<tr>
<td>$35 \leq t &lt; 40$</td>
<td>25</td>
</tr>
<tr>
<td>$40 \leq t &lt; 50$</td>
<td></td>
</tr>
<tr>
<td>$50 \leq t &lt; 70$</td>
<td></td>
</tr>
</tbody>
</table>

ii Copy and complete the histogram.

b Estimate how many passengers were delayed between 25 and 38 minutes.

6 The variable $y$ was measured to the nearest whole number. 60 observations were taken and are recorded in the table below.

<table>
<thead>
<tr>
<th>$y$</th>
<th>10–12</th>
<th>13–14</th>
<th>15–17</th>
<th>18–25</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>6</td>
<td>24</td>
<td>18</td>
<td>12</td>
</tr>
</tbody>
</table>

a Write down the class boundaries for the 13–14 class.

A histogram was drawn and the bar representing the 13–14 class had a width of 4 cm and a height of 6 cm.

For the bar representing the 15–17 class, find:

b i the width

b ii the height

7 The table here shows the hourly wage in euros for 31 employees working at a retail store. A histogram was drawn using this data. The $8 \leq w < 10$ group was represented by a bar of width 1 cm and a height of 8 cm.

<table>
<thead>
<tr>
<th>Hourly wage, $w$ (€)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>$4 \leq w &lt; 8$</td>
<td>4</td>
</tr>
<tr>
<td>$8 \leq w &lt; 10$</td>
<td>8</td>
</tr>
<tr>
<td>$10 \leq w &lt; 11$</td>
<td>6</td>
</tr>
<tr>
<td>$11 \leq w &lt; 12$</td>
<td>7</td>
</tr>
<tr>
<td>$12 \leq w &lt; 15$</td>
<td>5</td>
</tr>
<tr>
<td>$15 \leq w &lt; 16$</td>
<td>1</td>
</tr>
</tbody>
</table>

a Find the width and height of the bar representing the $10 \leq w < 11$ group.

b Estimate the mean and standard deviation of the employees working at the store.

c Use linear interpolation to find an estimate for the lower quartile of wages.

d Estimate how many employees had an hourly wage higher than the mean plus one standard deviation.
3.2 Outliers

An outlier is an extreme value that lies outside the overall pattern of the data.

There are a number of different ways of calculating outliers, depending on the nature of the data and the calculations that you are asked to carry out.

- A common definition of an outlier is any value that is:
  - either greater than $Q_3 + k(Q_3 - Q_1)$
  - or less than $Q_1 - k(Q_3 - Q_1)$

In the exam, you will be told which method to use to identify outliers in data sets, including the value of $k$.

Example 3

The blood glucose levels of 30 females are recorded. The results, in mmol/litre, are shown below:

- 1.7, 2.2, 2.3, 2.3, 2.5, 2.7, 3.1, 3.2, 3.6, 3.7, 3.7, 3.7, 3.8, 3.8, 3.8,
- 3.9, 3.9, 3.9, 4.0, 4.0, 4.0, 4.4, 4.5, 4.6, 4.7, 4.8, 5.0, 5.1

An outlier is an observation that falls either $1.5 \times$ the interquartile range above the upper quartile, or $1.5 \times$ the interquartile range below the lower quartile.

a) Find the quartiles.

- $Q_1 = \frac{30}{4} = 7.5$; pick the 8th term = 3.2
- $Q_3 = \frac{3(30)}{4} = 22.5$; pick the 23rd term = 4.0
- $Q_2 = \frac{30}{2} = 15$; pick the 15.5th term = 3.8

b) Interquartile range = $4.0 - 3.2 = 0.8$

Outliers are values less than $3.2 - 1.5 \times 0.8 = 2$

or greater than $4.0 + 1.5 \times 0.8 = 5.2$

Therefore 1.7 is the only outlier.
The lengths, in cm, of 12 giant African land snails are given below:
17, 18, 18, 19, 20, 20, 20, 20, 21, 23, 24, 32

a Calculate the mean and standard deviation, given that
\( \Sigma x = 252 \) and \( \Sigma x^2 = 5468 \).

b An outlier is an observation which lies \( \pm 2 \) standard deviations from the mean. Identify any outliers for these data.

\[ \text{Mean} = \frac{\Sigma x}{n} = \frac{252}{12} = 21 \text{ cm} \]

\[ \text{Variance} = \frac{\Sigma x^2}{n} - \bar{x}^2 = \frac{5468}{12} - 21^2 = 14.666... \]

\[ \text{Standard deviation} = \sqrt{14.666...} = 3.83 \text{ (3 s.f.)} \]

\[ \text{Mean} - 2 \times \text{standard deviation} = 21 - 2 \times 3.83 = 13.34 \]
\[ \text{Mean} + 2 \times \text{standard deviation} = 21 + 2 \times 3.83 = 28.66 \]

32 cm is an outlier.

Sometimes outliers are legitimate values (values that are acceptable according to the rules) which could be correct. For example, there really could be a giant African land snail 32 cm long.

However, there are occasions when an outlier should be removed from the data since it is clearly an error and it would be misleading to keep it in. These data values are known as anomalies (values that are different from what is normal or expected).

- The process of removing anomalies from a data set is known as cleaning the data.

Anomalies can be the result of experimental or recording error, or could be data values which are not relevant to the investigation.

Here is an example where there is a clear anomaly:

Ages of people at a birthday party: 12, 17, 21, 33, 34, 37, 42, 62, 165

\[ \bar{x} = 47 \quad \sigma = 44.02 \quad \bar{x} + 2\sigma = 135.04 \]

The data value recorded as 165 is significantly higher than \( \bar{x} + 2\sigma \), so it can be considered an outlier. An age of 165 is impossible, so this value must be an error. You can clean the data by removing this value before carrying out any analysis.

\[ \text{Notation} \quad \Sigma x \text{ is the sum of the data and } \Sigma x^2 \text{ is the sum of the square of each value.} \]

\[ \text{Watch out} \quad \text{Different questions might use different definitions of outliers. Read the question carefully before finding any outliers.} \]

\[ \text{Watch out} \quad \text{Be careful not to remove data values just because they do not fit the pattern of the data. You must justify why a value is being removed.} \]

\[ \text{Notation} \quad \gg \text{ is used to denote 'much greater than'. Similarly you can use } \ll \text{ to denote 'much less than'.} \]
1 Some data are collected. \( Q_1 = 46 \) and \( Q_3 = 68 \).

A value greater than \( Q_3 + 1.5 \times (Q_3 - Q_1) \) or less than \( Q_1 - 1.5 \times (Q_3 - Q_1) \) is defined as an outlier.

Using this rule, work out whether or not the following are outliers:

a 7  

b 88  

c 105

2 The masses of male and female turtles are given in grams. For males, the lower quartile was 400 g and the upper quartile was 580 g. For females, the lower quartile was 260 g and the upper quartile was 340 g.

An outlier is an observation that falls either \( 1 \times \) the interquartile range above the upper quartile or \( 1 \times \) the interquartile range below the lower quartile.

a Which of these male turtle masses would be outliers?

400 g  

260 g  

550 g  

640 g  

b Which of these female turtle masses would be outliers?

170 g  

300 g  

340 g  

440 g  

c What is the largest mass a male turtle can be without being an outlier?

3 The masses of arctic foxes are found and the mean mass was 6.1 kg. The variance was 4.2.

An outlier is an observation which lies ±2 standard deviations from the mean.

a Which of these arctic fox masses are outliers?

2.4 kg  

10.1 kg  

3.7 kg  

11.5 kg  

b What are the smallest and largest masses that an arctic fox can be without being an outlier?

4 The ages of nine people at a children’s birthday party are recorded. \( \Sigma x = 92 \) and \( \Sigma x^2 = 1428 \).

a Calculate the mean and standard deviation of the ages.

An outlier is an observation which lies ±2 standard deviations from the mean.

One of the ages is recorded as 30.

b State, with a reason, whether or not this is an outlier.

c Suggest a reason why this age could be a legitimate data value.

d Given that all nine people were children, clean the data and recalculate the mean and standard deviation.
3.3 Box plots

A box plot can be drawn to represent important features of the data. It shows the quartiles, maximum and minimum values and any outliers.

A box plot looks like this:

Two sets of data can be compared using box plots.

Example 5

a Draw a box plot for the data on blood glucose levels of females from Example 3.

Lower quartile = 3.2
Upper quartile = 4.0
Median = 3.8
Outlier = 1.7
Lowest value = 2.2
Highest value = 5.1

The blood glucose levels of 30 males are recorded. The results are summarised below:

Lower quartile = 3.6
Upper quartile = 4.7
Median = 4.0
Lowest value = 1.4
Highest value = 5.2

An outlier is an observation that falls either 1.5 × the interquartile range above the upper quartile or 1.5 × the interquartile range below the lower quartile.

b Given that there is only one outlier for the males, draw a box plot for these data on the same diagram as the one for females.

c Compare the blood glucose levels for males and females.
CHAPTER 3

REPRESENTATIONS OF DATA

The quartiles and outliers were found in Example 3. The outlier is marked with a cross. The lowest value which is not an outlier is 2.2.

Always use a scale and label it. Remember to give your box plot a title.

The end of the box plot is plotted at the outlier boundary (in this case 1.95) as we do not know the actual figure.

Problem-solving

When drawing two box plots, use the same scale so they can be compared. Remember to give each a title and label the axis.

When comparing data you should compare a measure of location and a measure of spread. You should also write your interpretation in the context of the question.

Exercise 3C

1 A group of students took a test. The summary data are shown in the table.

<table>
<thead>
<tr>
<th>Lowest mark</th>
<th>Lower quartile</th>
<th>Median</th>
<th>Upper quartile</th>
<th>Highest mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>21</td>
<td>28</td>
<td>36</td>
<td>58</td>
</tr>
</tbody>
</table>

Given that there were no outliers, draw a box plot to illustrate these data.

2 Here is a box plot of marks in an examination.
   a Write down the upper and lower quartiles.
   b Write down the median.
   c Work out the interquartile range.
   d Work out the range.
3 The masses of male and female turtles are given in grams. The data are summarised in the box plots.
   a. Compare and contrast the masses of the male and female turtles.
   b. A turtle was found to have a mass of 330 grams. State whether it is likely to be a male or a female. Give a reason for your answer.
   c. Write down the size of the largest female turtle.

4 The average weight (in kg) for 30 different breeds of dog are shown below.

   | 13 | 15 | 16 | 19 | 20 |
   | 21 | 22 | 22 | 24 | 24 |
   | 25 | 25 | 26 | 26 | 26 |
   | 27 | 29 | 29 | 30 | 30 |
   | 33 | 33 | 38 | 46 | 48 |

   a. Calculate Q1, Q2 and Q3.

   An outlier is defined as a value which lies either $1.5 \times$ the interquartile range above the upper quartile, or $1.5 \times$ the interquartile range below the lower quartile.

   b. Show that 46 kg and 48 kg are outliers.

   c. Draw a box plot for this data.

### 3.4 Stem and leaf diagrams

- A **stem and leaf diagram** is used to order and present data given to 2 or 3 significant figures. Each number is first split into its stem and leaf. For example, take the number 42:

  42

  - 4 is the stem
  - 2 is the leaf

- It enables the shape of the distribution of the data to be revealed, and quartiles can easily be found from the diagram.

- Two sets of data can be compared using back to back stem and leaf diagrams.

#### Example 6

The blood glucose levels of 30 males are recorded. The results, in mmol/litre, are given below.

   | 4.4 | 2.4 | 5.1 | 3.7 | 4.7 | 2.2 | 3.8 | 4.2 | 5.0 | 4.7 | 4.1 | 4.6 | 4.7 | 3.7 | 3.6 |
   | 2.1 | 2.5 | 3.8 | 4.2 | 4.0 | 3.5 | 4.8 | 5.1 | 4.5 | 3.6 | 1.4 | 3.2 | 4.7 | 3.6 | 5.2 |

   a. Draw a stem and leaf diagram to represent the data.

   b. Find:
      i. the mode
      ii. the lower quartile
      iii. the upper quartile
      iv. the median.
a. Step 1: Rearrange the numbers in ascending order.

1.4, 2.1, 2.2, 2.4, 2.5, 3.2, 3.5, 3.6, 3.6, 3.7, 3.7, 3.8, 3.8, 4.0, 4.1, 4.2, 4.2, 4.4, 4.5, 4.6, 4.7, 4.7, 4.7, 4.8, 5.0, 5.1, 5.1, 5.2

Step 2: Choose an appropriate stem and leaf for the data. For these data, the whole number part is chosen as the stem and the decimal part is chosen as the leaf.

Step 3: Draw the stem and leaf diagram.

<table>
<thead>
<tr>
<th>Stem</th>
<th>Leaf</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4</td>
</tr>
<tr>
<td>2</td>
<td>1 2 4 5</td>
</tr>
<tr>
<td>3</td>
<td>2 5 6 6 6 7 7 8 8</td>
</tr>
<tr>
<td>4</td>
<td>0 1 2 2 4 5 6 7 7 7 7 8</td>
</tr>
<tr>
<td>5</td>
<td>0 1 1 2</td>
</tr>
</tbody>
</table>

Step 4: Include a key.

<table>
<thead>
<tr>
<th>Stem</th>
<th>Leaf</th>
<th>Key: 1</th>
<th>4 = 1.4</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>1 2 4 5</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>2 5 6 6 6 7 7 8 8</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>0 1 2 2 4 5 6 7 7 7 7 8</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>0 1 1 2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

b. Stem | Leaf                      | Key: 1 | 4 = 1.4 |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>1 2 4 5</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>2 5 6 6 6 7 7 8 8</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>0 1 2 2 4 5 6 7 7 7 7 8</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>0 1 1 2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

i. From the diagram, you can see the mode is 4.7 as it occurs the most frequently.

ii. Lower quartile: \(\frac{30}{4} = 7.5\), so pick the 8th term which is 3.6

iii. Upper quartile: \(\frac{3(30)}{4} = 22.5\), so pick the 23rd term which is 4.7

iv. Median \(\frac{30}{2} = 15\), so pick the 15.5th term which is 4.05 (halfway between 4.0 and 4.1)
Achara recorded the resting pulse rate for the 16 boys and 23 girls in her year at school. The results were as follows:

<table>
<thead>
<tr>
<th>Girls</th>
<th>55 80 84 91 80 92</th>
<th>Boys</th>
<th>80 60 91 65</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>98 40 60 64 66 72</td>
<td></td>
<td>67 59 75 46</td>
</tr>
<tr>
<td></td>
<td>96 85 88 90 76 54</td>
<td></td>
<td>72 71 74 57</td>
</tr>
<tr>
<td></td>
<td>58 92 78 80 79</td>
<td></td>
<td>64 60 50 68</td>
</tr>
</tbody>
</table>

a Construct a back to back stem and leaf diagram to represent these data.

b Comment on your results.

---

Example 7

**SKILLS** INTERPRETATION; EXECUTIVE FUNCTION

An outlier is an observation that falls either 1.5 x the interquartile range above the upper quartile or 1.5 x the interquartile range below the lower quartile.

a Find the quartiles.

b Find any outliers.

---

Example 8

**SKILLS** ANALYSIS

The blood glucose levels of 30 females are recorded. The results, in mmol/litre, are shown in the stem and leaf diagram below:

<table>
<thead>
<tr>
<th>Stem</th>
<th>Leaf</th>
<th>Key: 2</th>
<th>1 = 2.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>2 2 3 3 5 7</td>
<td>(6)</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>1 2 6 7 7 8 8 8 9 9 9</td>
<td>(13)</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>0 0 0 4 5 6 7 8</td>
<td>(9)</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>1 5</td>
<td>(2)</td>
<td></td>
</tr>
</tbody>
</table>

An outlier is an observation that falls either 1.5 x the interquartile range above the upper quartile or 1.5 x the interquartile range below the lower quartile.

a Find the quartiles.

b Find any outliers.
b Interquartile range $= 4.0 - 3.2 = 0.8$
Outliers are values less than $3.2 - (1.5 \times 0.8) = 2$
or values greater than $4.0 + (1.5 \times 0.8) = 5.2$
Therefore 5.5 is an outlier.

Exercise 3D

1 Thirty college students were asked how many movies they had in their collection.
The results are as follows:
$$
\begin{array}{cccccccccccccccc}
12 & 25 & 34 & 17 & 12 & 18 & 29 & 34 & 45 & 6 & 15 & 9 & 25 & 3 & 29 \\
\end{array}
$$
Draw a stem and leaf diagram to represent these data.

a Find the median.
b Find the lower quartile.
c Find the upper quartile.

2 The following stem and leaf diagram shows some information about the marks gained by a
group of students in a statistics test.

| Stem | Leaf | Key: 2|3 means 23 marks |
|------|------|--------|
| 0    | 8    | (2)    |
| 1    | 2    | (4)    |
| 2    | 3    | (5)    |
| 3    | 4    | (9)    |
| 4    | 5    | (4)    |

a Write down the highest mark.
b Write down the lowest mark.
c How many students scored 26 marks?
d What is the modal mark?
e Find the median.
f Find the lower quartile.
g Find the upper quartile.

3 A class of 16 boys and 13 girls completed a Physics test. The test was marked out of 60.
Their marks are shown below:

<table>
<thead>
<tr>
<th>Boys</th>
<th>Girls</th>
</tr>
</thead>
<tbody>
<tr>
<td>45 64 32 60</td>
<td>26 54 47 32</td>
</tr>
<tr>
<td>28 34 54 56</td>
<td>34 34 45 46</td>
</tr>
<tr>
<td>32 29 47 48</td>
<td>39 52 24 28</td>
</tr>
<tr>
<td>44 45 56 57</td>
<td>33</td>
</tr>
</tbody>
</table>

a Draw back to back stem and leaf diagrams to represent these data.
b Comment on your results.
3.5 Skewness

The shape (skewness) of a data set can be described using diagrams, measures of location and measures of spread.

- A distribution can be symmetrical, have a positive skew or have a negative skew.

- Data which are spread evenly are symmetrical.
- Data which are mostly at lower values have a positive skew.
- Data which are mostly at higher values have a negative skew.

There are several ways of comparing skewness. Sometimes you will be told which to use, and sometimes you will have to choose one depending on what data you have available.

You can see the shape of the data from a box plot. You can also look at the quartiles.

- Symmetrical $Q_2 - Q_1 = Q_3 - Q_2$
- Positive Skew $Q_2 - Q_1 < Q_3 - Q_2$
- Negative Skew $Q_2 - Q_1 > Q_3 - Q_2$

4 The stem and leaf diagram below shows the median age, in years, of a selection of African elephants in Tanzania.

<table>
<thead>
<tr>
<th>Stem</th>
<th>Leaf</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>5 6 6 6 7 7 7 7 8 8 8 8 8 9 9 9 9 9 9 9 9 9 9 9</td>
</tr>
<tr>
<td>2</td>
<td>0 0 0 0 0 0 1 1 1 1 3 3 3 4 5 7</td>
</tr>
<tr>
<td>3</td>
<td>4 4</td>
</tr>
<tr>
<td>4</td>
<td>1</td>
</tr>
</tbody>
</table>

Find:
- the median
- the interquartile range and any outliers.

Key: $1|8 = 18$ years
Another test uses the measures of location:
- Mode = median = mean describes a distribution which is **symmetrical**
- Mode < median < mean describes a distribution with a **positive skew**
- Mode > median > mean describes a distribution with a **negative skew**

You can also calculate \( \frac{3(\text{mean} - \text{median})}{\text{standard deviation}} \) which tells you how **skewed** the data are.

<table>
<thead>
<tr>
<th>Negative skew</th>
<th>Symmetrical</th>
<th>Positive skew</th>
</tr>
</thead>
<tbody>
<tr>
<td>A value of 0 implies that the mean = median and the distribution is <strong>symmetrical</strong></td>
<td>A positive value implies that the median &lt; mean and the distribution is <strong>positively skewed</strong></td>
<td>A negative value implies that median &gt; mean and the distribution is <strong>negatively skewed</strong></td>
</tr>
<tr>
<td>The further from 0 the value is, the more likely the data will be skewed.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example 9**

The following stem and leaf diagram shows the scores obtained by a group of students in a test.

| Score | Key: 6| means 61 |
|-------|--------|
| 2 1 2 8 | (3) |
| 3 3 4 7 8 9 | (5) |
| 4 1 2 3 5 6 7 9 | (7) |
| 5 0 2 3 5 5 6 8 9 9 | (10) |
| 6 1 2 2 3 4 4 5 6 8 8 8 9 9 | (14) |
| 7 0 2 3 4 5 7 8 9 | (8) |
| 8 0 1 4 | (3) |

The modal value is 68, the mean is 57.46 and the standard deviation is 15.7 for these data.

a. Find the three quartiles for this data set.

b. Calculate the value of \( \frac{3(\text{mean} - \text{median})}{\text{standard deviation}} \) and comment on the skewness.

c. Use two further methods to show that the data are negatively skewed.
1 In a survey of the earnings of some college students who worked weekend jobs, the median wage was $36.50. The 75th percentile was $45.75 and the interquartile range was $30.50. Use the quartiles to describe the skewness of the distributions.

2 A group of estate agents recorded the time spent on the first meeting with a random sample of 120 of their clients. The mean time spent with their clients is 31.1 minutes and the variance is 78.05. The median time is 29.7 minutes and Q1 and Q3 values are 25.8 minutes and 34.8 minutes.

One measure of skewness is found using \( \frac{3(\text{mean} - \text{median})}{\text{standard deviation}} \).

a Evaluate this measure and describe the skewness of the data

The estate agents are undecided whether to use the median and quartiles, or the mean and standard deviation to summarise the data.

b State, giving a reason, which you would recommend for them to use.
3 The following stem and leaf diagram summarises the wing length, to the nearest mm, of a random sample of 67 birds.

| Wing length | Key: 5|0 means 50mm |
|-------------|-------|
| 5           | 0 0 0 1 1 2 2 3 3 3 3 4 4 | (12) |
| 5           | 5 5 6 6 6 7 8 8 9 9       | (10) |
| 6           | 0 1 1 1 3 3 4 4 4 4       | (10) |
| 6           | 5 5 6 7 8 9 9             | (7)  |
| 7           | 1 1 2 2 3 3               | (6)  |
| 7           | 5 7 9 9                  | (4)  |
| 8           | 1 1 1 2 2 3 3 4           | (8)  |
| 8           | 7 8 9                    | (3)  |
| 9           | 0 1 1 2                  | (4)  |
| 9           | 5 7 9                    | (3)  |

a Write down the mode.
b Find the median and quartiles of the data.
c Construct a box plot to represent the data.
d Comment on the skewness of the distribution.
e Calculate the mean and standard deviation for the data.
f Use another method to show that the data is skewed.
g State, giving a reason, which of b or e you would recommend using to summarise the data in the diagram.

An orange farmer randomly selects 120 oranges from her farm. The histogram below shows the diameters (in mm) of the oranges.

Calculate an estimate of the mean and standard deviation. Comment on why the mean is only an estimate, whether there any outliers, and the type of skewness displayed by the histogram.
When comparing data sets you can comment on:

- a measure of location
- a measure of spread

You can compare data by using the mean and standard deviation or by using the median and interquartile range. If the data set contains extreme values, then the median and interquartile range are more appropriate statistics to use.

**Example 10**

The daily mean temperature (°C) during August is recorded at London Heathrow Airport and Dubai International Airport.

For London Heathrow, \( \Sigma x = 562.0 \) and \( \Sigma x^2 = 10,301.2 \)

**a** Calculate the mean and standard deviation for London Heathrow.

For Dubai International, the mean temperature was 31 °C with a standard deviation of 1.35 °C.

**b** Compare the data for the two airports using the information given.

\[
\bar{x} = \frac{562.0}{31} = 18.12\ldots = 18.1°C \text{ (3 s.f.)}
\]

\[
\sigma = \sqrt{\frac{10,301.2}{31} - \left(\frac{562.0}{31}\right)^2} = 1.906\ldots = 1.91°C \text{ (3 s.f.)}
\]

The mean daily temperature at Dubai International is significantly higher and the spread of temperatures is lower than at London Heathrow.

Use \( \bar{x} = \frac{\Sigma x}{n} \). There are 31 days in August, so \( n = 31 \).

Use your calculator to do this calculation in one step. Round your final answer to 3 significant figures.

Compare the mean and standard deviation as a measure of location and a measure of spread.

**Exercise 3F**

The box plots below show the distribution of speeds of cars on two motorways.

Compare the distributions of the speeds on the two motorways.
2 Two classes of primary school children complete a puzzle. Summary statistics for the times the children took, in minutes, are shown in the table.

<table>
<thead>
<tr>
<th></th>
<th>n</th>
<th>Σx</th>
<th>Σx²</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class 2B</td>
<td>20</td>
<td>650</td>
<td>22000</td>
</tr>
<tr>
<td>Class 2F</td>
<td>22</td>
<td>598</td>
<td>19100</td>
</tr>
</tbody>
</table>

Calculate the mean and standard deviation of the times and compare the distributions.

3 The stem and leaf diagram below shows the age, in years, of the members of a sports club.

Male
8 8 7 6
7 6 5 5 3 3 2 1
9 8 4 4 3
5 2 1
9 0

Female
1 1 0 9
2 0 1 8
9 0

Key: 1|4|0 represents a male aged 41 and a female aged 40

a Find the median and interquartile range for the males.

b The median and interquartile ranges for the females are 27 and 15 respectively.

Make two comparisons between the ages of the males and females.

4 In the box plots here, the marks for a group of students taking their Mathematics exam for the first time are shown on the top.

The marks for a group of students who are retaking their Mathematics exam are shown on the bottom.

Compare and contrast the marks between the two groups taking the exam. (3 marks)

Chapter review
3 SKILLS PROBLEM-SOLVING; ANALYSIS

1 Aroon and Bassam decided to go on a touring holiday in Europe for the whole of July. They recorded the distance they drove, in kilometres, each day:

155, 164, 168, 169, 175, 175, 177, 178, 178, 179, 179, 179, 184, 184, 185, 185, 188, 192, 193, 194, 195, 195, 196, 204, 207, 208, 209, 211, 212, 226

a Draw a stem and leaf diagram and find Q₁, Q₂ and Q₃.

Outliers are values that lie below Q₁ – 1.5(Q₃ – Q₁) or above Q₃ + 1.5(Q₃ – Q₁).

b Find any outliers.

c Draw a box plot of these data.

d Comment on the skewness of the distribution.
2 Cross-country runners from the Marathon Club and the Runners Club were keen to see which club had the faster runners overall. They decided that all the members from both clubs would take part in a cross-country run. The time each runner took to complete the run was recorded.

The results are summarised in the box plots.

![Box plots for Marathon Club and Runners Club](image)

a Write down the time by which 50% of the Marathon Club runners had completed the run.
b Write down the time by which 75% of the Runners Club runners had completed the run.
c Explain what is meant by the cross (×) on the Marathon Club box plot.
d Compare and contrast these two box plots.
e What conclusions can you draw from this information about which club has the faster runners?
f Give one advantage and one disadvantage of comparing distributions using box plots.

3 Random samples of 35 tortoises were taken from two different zoos and their ages were recorded. The results are summarised in the back to back stem and leaf diagram below.

<table>
<thead>
<tr>
<th>Zoo 1</th>
<th>Zoo 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 7</td>
<td>2 5</td>
</tr>
<tr>
<td>9 8 7</td>
<td>3 1</td>
</tr>
<tr>
<td>4 4 4 0</td>
<td>0 1 2 4 7</td>
</tr>
<tr>
<td>6 6 5 2 2</td>
<td>5 0 0 5 5</td>
</tr>
<tr>
<td>8 6 5 4 2 4 1 1</td>
<td>6 2 5 6 6</td>
</tr>
<tr>
<td>8 6 6 6 4 3 1 1</td>
<td>7 0 5</td>
</tr>
<tr>
<td>9 8 4 3 2</td>
<td>8</td>
</tr>
<tr>
<td>4</td>
<td>9</td>
</tr>
</tbody>
</table>

Key: 7|3|1 means 37-year-olds for Zoo 1 and 31-year-olds for Zoo 2

a The lower quartile, median and upper quartile for Zoo 1 are 44, 64 and 76 years respectively. Find the median and the quartiles for Zoo 2.
b An outlier is a value that falls either:
more than $1.5 \times (Q_3 - Q_1)$ above $Q_3$ or
more than $1.5 \times (Q_3 - Q_1)$ below $Q_1$

State any outliers in the above data for Zoo 2.
c State the skewness of each distribution. Justify your answer.
4 The histogram shows the time taken by a group of 58 girls to run a measured distance.
   a Work out the number of girls who took longer than 56 seconds.
   b Estimate the number of girls who took between 52 and 55 seconds.

5 The table gives the distances travelled to school, in km, of the population of children in a particular region of the United Kingdom.

<table>
<thead>
<tr>
<th>Distance, $d$ (km)</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>$0 \leq d &lt; 1$</td>
<td>2565</td>
</tr>
<tr>
<td>$1 \leq d &lt; 2$</td>
<td>1784</td>
</tr>
<tr>
<td>$2 \leq d &lt; 3$</td>
<td>1170</td>
</tr>
<tr>
<td>$3 \leq d &lt; 5$</td>
<td>756</td>
</tr>
<tr>
<td>$5 \leq d &lt; 10$</td>
<td>630</td>
</tr>
<tr>
<td>$10 \leq d$</td>
<td>135</td>
</tr>
</tbody>
</table>

A histogram of these data was drawn with distance along the horizontal axis. A bar of horizontal width 1.5 cm and height 5.7 cm represented the $0 \text{--} 1$ km group. Find the widths and heights, in cm, to 1 decimal place, of the bars representing the following groups:
   a $2 \leq d < 3$
   b $5 \leq d < 10$

6 The labelling on bags of garden compost indicates that the bags have a mass of 20 kg. The actual masses of a random sample of 50 bags are summarised in the table opposite.

<table>
<thead>
<tr>
<th>Mass, $m$ (kg)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>$14.6 \leq m &lt; 14.8$</td>
<td>1</td>
</tr>
<tr>
<td>$14.8 \leq m &lt; 18.0$</td>
<td>6</td>
</tr>
<tr>
<td>$18.0 \leq m &lt; 18.5$</td>
<td>5</td>
</tr>
<tr>
<td>$18.5 \leq m &lt; 20.0$</td>
<td>0</td>
</tr>
<tr>
<td>$20.0 \leq m &lt; 20.2$</td>
<td>22</td>
</tr>
<tr>
<td>$20.2 \leq m &lt; 20.4$</td>
<td>15</td>
</tr>
<tr>
<td>$20.4 \leq m &lt; 21.0$</td>
<td>1</td>
</tr>
</tbody>
</table>

a On graph paper, draw a histogram of these data.
b Estimate the mean and standard deviation of the mass of a bag of compost.
(You may use $\Sigma f y = 988.85$, $\Sigma f y^2 = 19602.84$)
c Using linear interpolation, estimate the median.
d One measure of skewness is given by $\frac{(\text{mean} - \text{median})}{\text{standard deviation}}$. Evaluate this coefficient for the data.
e Comment on the skewness of the distribution of the weights of bags of compost.
7 The number of bags of potato crisps sold per day in a coffee shop was recorded over a two-week period. The results are shown below.

20 15 10 30 33 40 5 11 13 20 25 42 31 17

a Calculate the mean of these data.
b Draw a stem and leaf diagram and find the median and quartiles for these data.

An outlier is an observation that falls either $1.5 \times$ the interquartile range above the upper quartile or $1.5 \times$ the interquartile range below the lower quartile.
c Determine whether or not any items of data are outliers.
d On graph paper, draw a box plot to represent these data. Show your scale clearly.
e Comment on the skewness of the distribution of bags of crisps sold per day. Justify your answer.

8 For three weeks, Suha and Jameela each count the number of bicycles they see on their routes to school. The data they collected are summarised in this back to back stem and leaf diagram.

```
Suha   Jameela
|   9   9   7   5   0   6   6|
7 6 5 3 3 2 2 2 1 1 1 1 2 1 3
5 3 3 2 2
2 1
|   3   2   3   4   7   7 8 9|
```

Key: 5 | 0 | 6 means Suha counts 5 bicycles and Jameela counts 6 bicycles

a Write down the modal number of bicycles Jameela counts on her route.

The quartiles are summarised in the table below:

<table>
<thead>
<tr>
<th>Suha</th>
<th>Jameela</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lower quartile</td>
<td>X</td>
</tr>
<tr>
<td>Median</td>
<td>13</td>
</tr>
<tr>
<td>Upper quartile</td>
<td>Z</td>
</tr>
</tbody>
</table>

b Find the values of X, Y, and Z.

c The table shows summary statistics of the mean daily temperature in Toronto in April 1987 and April 2015.

<table>
<thead>
<tr>
<th></th>
<th>Min</th>
<th>Max</th>
<th>Median</th>
<th>$\Sigma x$</th>
<th>$\Sigma x^2$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1987</td>
<td>7.0</td>
<td>17.0</td>
<td>11.85</td>
<td>356.1</td>
<td>4408.9</td>
</tr>
<tr>
<td>2015</td>
<td>10.1</td>
<td>14.1</td>
<td>12.0</td>
<td>364.1</td>
<td>4450.2</td>
</tr>
</tbody>
</table>

9 a Calculate the mean of the mean daily temperatures in each of the two years.

b In 2015, the standard deviation was 1.02. Compare the mean daily temperatures in the two years.

c A recorded temperature is considered ‘normal’ for the time of year if it is within one standard deviation of the mean. Estimate for how many days in April 2015 a ‘normal’ mean daily temperature was recorded. State one assumption you have made in making the estimate.
Challenge

The table shows the lengths of the films in a film festival, to the nearest minute.

<table>
<thead>
<tr>
<th>Length (min)</th>
<th>Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>70–89</td>
<td>4</td>
</tr>
<tr>
<td>90–99</td>
<td>17</td>
</tr>
<tr>
<td>100–109</td>
<td>20</td>
</tr>
<tr>
<td>110–139</td>
<td>9</td>
</tr>
<tr>
<td>140–179</td>
<td>2</td>
</tr>
</tbody>
</table>

A histogram is drawn to represent the data, and the bar representing the 90–99 class is 3 cm higher than the bar representing the 70–89 class.

Find the height of the bar chart representing the 110–139 class.

Summary of key points

1. A common definition of an outlier is any value that is:
   - greater than $Q_3 + k(Q_3 - Q_1)$
   - or less than $Q_1 - k(Q_3 - Q_1)$

2. The process of removing anomalies from a data set is known as cleaning the data.

3. On a histogram, to calculate the height of each bar (the frequency density) use the formula: area of bar = $k \times$ frequency

4. Joining the middle of the top of each bar in a histogram forms a frequency polygon.

5. When comparing data sets you can comment on:
   - a measure of location
   - a measure of spread

6. A stem and leaf diagram reveals the shape of the data and enables quartiles to be found.

7. Two sets of data can be compared using back to back stem and leaf diagrams.

8. A box plot represents important features of the data. It shows quartiles, maximum and minimum values, and any outliers.

9. Box plots can be used to compare two sets of data.

10. Diagrams, measures of location, and measures of spread can be used to describe the shape (skewness) of a data set.

11. You can describe whether a distribution is skewed using:
   - quartiles
   - shape from box plots
   - measures of location
   - the formula $\frac{3(\text{mean} - \text{median})}{\text{standard deviation}}$, where a larger value means greater skew.
