Health informatics

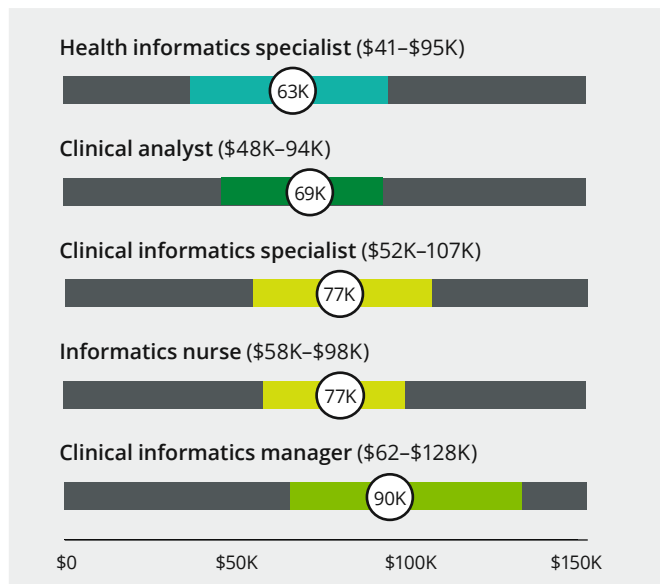

Health informatics involves the digital management and analysis of healthcare information.⁽¹⁾ While this subset of the medical field has been around for some time, it's skyrocketed in the past decade with advances in technology, an aging population, and the introduction of the Affordable Care Act, which has a goal of leveraging technology to improve health outcomes. Practitioners in the field — who combine expertise in computer science, information science, and healthcare — support patients with digital systems that give them access to their own health data, allow coordinated care teams to share data, and support the identification of larger public health trends.⁽²⁾

Those looking to enter the field can take a number of paths. Clinical and IT roles vary depending on the size and nature of the institution, but often they establish or manage the technological systems being used for patient care. Nurse informatics more specifically addresses how technology and data can support and improve nurses' workflow. And for the most analytically minded, public health informatics focuses on connecting and interpreting data for

practitioners to serve larger communities (most recently, this includes efforts such as COVID-19 contact tracing). Additional sub-specialties exist in pharmacology and imaging.^(3,4)

Study options available

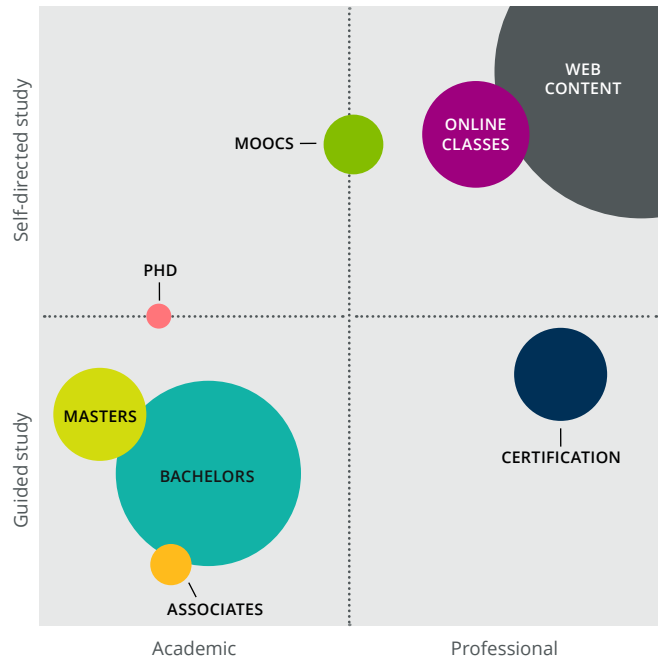

Because demand is high for qualified health informatics practitioners, there's a proliferation of educational opportunities, and they cover almost all degree levels with a range of financial and time commitment (both traditional and online). Options also vary depending on the individual's background — with additional paths available to those who have experience in the medical field.

Working healthcare professionals may only need to pursue an informatics certificate to make a career shift. Those entering the field from the ground floor (or laterally from the technology industry) will find options for associate, bachelors, and masters degrees. An associate degree is suitable for those interested in technician or assistant roles, while a higher degree is recommended for a specialist, administrative, or managerial path. There are even a small number of PhD options for those interested in specialized research, academia, or systemic innovation^(9,10)

Insider advice

"There are masters degree programs in informatics, of course, but you can begin with learning on the job. Also, it's important to understand that informatics is more than just IT. Informatics also means having an understanding of nurses' workflow, how and why they do what they do, and how electronic documentation can enhance or hinder patient care and nurse efficiency and function."
