I wish I could answer what the future of online learning is. Because I feel like sometimes we're driving down a highway at 90 miles an hour in a car that's turning into an airplane that may turn into a rocket and trying to keep it between the roads. Because there's so much going on and there's so much that can be done.

I'm really interested that we expand our creativity and help students, but first we have to do it as faculty. That we help students really be creative in how they think.

Hearing about some of the new tools to help online learning that are being developed now, one of the primary ones that we've been talking about is artificial intelligence. And how that can help extend what the faculty member is able to do and that, in such a way that the student gets a better experience.

I think the future of online learning will only grow. And will bring people together and get better and better at having them collaborate with each other.

I think if, what we try to do is keep in mind, what is it the students are trying to accomplish? How do we help them? And the future will be who answers those questions best. How do we best help students?
