Patterning and Algebra

## Activity 9 Assessment

Using Equations with Two Operations to Solve Problems

| Variables and Equations |  |  |  |
| :---: | :---: | :---: | :---: |
| Evaluates a numerical expression using the order of operations $\begin{aligned} 2 \times(30+18)-3 & =2 \times 48-3 \\ & =96-3 \\ & =93 \end{aligned}$ <br> "I have to do the operation in brackets first, then the multiplication, and then the subtraction." | Writes an algebraic expression to describe an unknown value <br> Subtract five from a number, then multiply by two $(n-5) \times 2$ <br> "I let $n$ represent the number. I used brackets so 5 would be subtracted first." | Evaluates an algebraic expression using substitution $(n-5) \times 2$ <br> "To find the value of the expression when $n$ equals 12 , I substitute 12 for $n$." $\begin{aligned} (n-5) \times 2 & =(12-5) \times 2 \\ & =7 \times 2 \\ & =14 \end{aligned}$ | Solves equations involving one operation using different strategies $\begin{aligned} 23 & =e+15 \\ 23-15 & =e+15-15 \\ 8 & =e \end{aligned}$ <br> "I used the inverse operation, subtracting 15 from each side." |

Patterning and Algebra

## Activity 9 Assessment

Using Equations with Two Operations to Solve Problems

| Variables and Equations (cont'd) |  |  |  |
| :---: | :---: | :---: | :---: |
| Solves equations involving two operations using different strategies $\begin{aligned} 29 & =3 z+2 \\ 29-2 & =3 z+2-2 \\ 27 & =3 z \\ \frac{27}{3} & =\frac{3 z}{3} \\ 9 & =z \end{aligned}$ <br> "I performed the order of operations in the reverse order to isolate the variable. I subtracted 2 from each side, then divided each side by 3 ." | Verifies the solution to an equation $29=3 z+2$ <br> "To verify, substitute $z=9$. $\begin{aligned} \text { Left side } & =29 \\ \text { Right side } & =3(9)+2 \\ & =27+2 \\ & =29 \end{aligned}$ <br> Since the left side equals the right side, my solution is correct." | Solves problems using equations involving one or two operations <br> Kairis sold 16 tickets. <br> That is twice as many tickets as Grace sold. <br> How many tickets did Grace sell? <br> Let $t$ represent the number of tickets Grace sold. $\begin{gathered} 2 t=16 \\ \frac{2 t}{2}=\frac{16}{2} \\ t=8 \end{gathered}$ <br> "So, Grace sold 8 tickets." | Flexibly works with equations to solve problems using a variety of strategies <br> At the grocery store, there are 5 lines of people at the checkouts. There are the same number of people in each line. <br> The manager counts to determine the total number of people at the checkouts, including 6 employees (including the manager). They counted 51 people. How many people are in each line? <br> Let $n$ represent the number of people in each line. $\begin{aligned} 5 n+6 & =51 \\ 5 n+6-6 & =51-6 \\ 5 n & =45 \\ n & =9 \end{aligned}$ <br> "I know $5 \times 9=45$, so $n=9$. <br> There are 9 people in each line." |
