

# Why Spiders Make Webs

Spiders make webs to catch their food. They make them sticky or very thick. Insects get trapped in them.

Spiders also make webs to live in. Their webs can warn them of danger. If the web is bumped, the spider feels the movement. Then it quickly moves away and hides.

Some spiders make webs to protect their babies. This spider has made a web that looks like a tent. It keeps the baby spiders safe.

This nursery web spider uses her web to protect her babies.
